## Application

This specification concerns the FTP-6X8DCL/DSL45Xseries(450-499)that controls the thermal printer mechanism FTP-628/638MCL4XXseries.

Prior to use this product, refer to the precautions in the Appendix to insure careful handling.

FTP-6X8DCL/DSL45X series include parts number as below,

| Part number | | Mounted circuit or devices | | | |
|---|---|---|---|---|---|
| | | Cutter Circuit | Flash Memory (Chinese Character Type) | SRAM: (Static Random Access Memory) | Interface |
| (1) | FTP-628DCL490<br>FTP-638DCL490 | Yes | No | No | Centronics/RS-232C |
| (2) | FTP-628DCL491<br>FTP-638DCL491 | Yes | No | Yes | Centronics/RS-232C |
| (3) | FTP-628DSL493<br>FTP-638DSL493 | Yes | Yes (Maru Gothic) | Yes | Centronics/RS-232C |
| (4) | FTP-628DSL498<br>FTP-638DSL498 | Yes | Yes (Minchou) | Yes | Centronics/RS-232C |
| (5) | FTP-628DSL499<br>FTP-638DSL499 | Yes | Yes (Minchou) | Yes | Centronics/RS-232C<br>(with SW1,2、LED1,2) |

## SECTION A
## Features

The features of the printer unit using this control board and printer mechanism FTP-628/638MCL series are as follows.

1. Maximum 60 mm/second high-speed printing. (standard paper, high-speed collective image printing mode, only when SRAM is mounted)
2. Centronics conforming parallel interface, RS-232C interface.*1
3. Based on ESC/POS™ command.*2
4. Automatic starting point detection function by mark detection method is included.
5. Paper cut function is included.*3
6. Paper run out, platen open (head-up), head temperature abnormality, motor temperature abnormality, paper near end, head voltage abnormality functions are included.
7. Various papers can be selected by commands.
8. 384dots/line (628MCL), 576dots/line (638MCL) printing with 8 lines/mm high resolution.
9. Stable printing quality by temperature detection function.
10. Stable printing quality by thermal head driving voltage detection function.
11. 24 dots type character (12x24 dots font and 24x24 dots font), 16 dots type character (8x16 dots font and 16x16dots font) can be selected by commands.
12. MCU operation abnormality detection function by watchdog timer is included
13. The circuit of motor over-current protection fuse is included.
14. Various bar code commands are supported.
15. Character registration function is included.*4
16. Power down function is included.

Note *1) The interface circuits carried by the model differ.
*2) ESC/POS™ is the registered trademark of Seiko Epson Corp.
*3) The cutter drive circuit can be specified by the model.
*4) Only when Flash ROM or SRAM is mounted.

# General Specifications

## 1 Print Specification

### 1.1 Printing System

Thermal printing system

### 1.2 Thermal Head Configuration

| Item | Specification | |
|---|---|---|
| | FTP-628MCL | FTP-638MCL |
| Resolution | 8dots/mm | |
| Heating Unit Size | 0.125mm (Vertical) x 0.125mm (Horizontal) | |
| Number of Heating Units | 384 | 576 |
| Effective Printing Area | About 48mm | About 72mm |

### 1.3 Number of Digits of Print Characters

| Print Mode | Type | | Number of digits | |
|---|---|---|---|---|
| | | | FTP-628MCL | FTP-638MCL |
| Alphanumeric Katakana | Internal half size character | 12x24 | 32 | 48 |
| | Internal full size character | 24x24 | 16 | 24 |
| | Registered half size character | 12x24 | 32 | 48 |
| | Registered full size character | 24x24 | 16 | 24 |
| | Internal half size character | 8x16 | 48 | 72 |
| | Internal full size character | 16x16 | 24 | 36 |
| | Registered half size character | 8x16 | 48 | 72 |
| | Registered full size character | 16x16 | 24 | 36 |
| Kanji*2) (Chinese Character) | Kanji, non-kanji | 24x24 | 16 | 24 |
| | Kanji, non-kanji | 16x16 | 24 | 36 |

1.4 Type of Print Characters and Character Configuration

| Print Mode | Type | | Number of Characters |
|---|---|---|---|
| Alphanumeric Katakana | Internal half size character | 12x24 | 159 |
| | Internal full size character | 24x24 | 159 |
| | Internal half size character | 8x16 | 159 |
| | Internal full size character | 16x16 | 159 |
| Registered Characters*1) | Registered half size character | 12x24 | 224 |
| | Registered full size character | 24x24 | 224 |
| | Registered half size character | 8x16 | 224 |
| | Registered full size character | 16x16 | 224 |
| International, Special | Internal half size character | 12x24 | 195 |
| | Internal full size character | 24x24 | 195 |
| | Internal half size character | 8x16 | 195 |
| | Internal full size character | 16x16 | 195 |
| Kanji*2) (Chinese Character) | Kanji, non-kanji | 24x24 | About 6800 |
| | Kanji, non-kanji | 16x16 | About 6800 |

*1)Only when flash memory or SRAM is mounted

*2)Only when flash memory is mounted

1.5 Print Mode

(1) Character Space

| Print Mode | Type | | Character Space (Number of dots) |
|---|---|---|---|
| Alphanumeric Katakana | Internal half size character | 12x24 | 12 |
| | Internal full size character | 24x24 | 24 |
| | Internal half size character | 8x16 | 8 |
| | Internal full size character | 16x16 | 16 |
| Registered Characters | Registered half size character | 12x24 | 12 |
| | Registered full size character | 24x24 | 24 |
| | Registered half size character | 8x16 | 8 |
| | Registered full size character | 16x16 | 16 |
| Kanji (Chinese Character) | Kanji, non-kanji | 24x24 | 24 |
| | Kanji, non-kanji | 16x16 | 16 |

## 4 Functional Specification

(1) Self test print function
(2) Paper feed function — By /ATF signal
(3) Paper run out detection function — By internal sensor of printer mechanism
(4) Paper near end detection function — By external mechanical switch
(5) Platen open detection function — By internal mechanical switch of printer mechanism
(6) Thermal head temperature detection function — By internal thermistor of printer mechanism
(7) Voltage detection function
(8) Cutter abnormality detection function
(9) Internal RAM abnormality detection function
(10) Mark detection function — By GS < command
(11) MCU operation abnormality detection function — By watchdog timer
(12) Motor power saving function
(13) Power supply disconnection protection function — By power switching FET
(14) Motor protection function — By fuse
(15) Thermal head protection function — By hardware timer

# 5 General Specifications

## 5.1.1 Power Consumption Driving Head

Voltage: 4.2V～8.5V (without cutter)

Current: See the following table

| Printing rate \ Speed | Model | High Speed Image Print Mode (About60mm/s) | High Speed Print Mode (About60mm/s) | Middle Speed Print Mode (About50mm/s) | Low Speed Print Mode (About30mm/s) |
|---|---|---|---|---|---|
| 12.5% | 628MCL | 0.9 (1.8) | 0.9 (0.9) | 0.8 (0.9) | 0.4 (0.6) |
| | 638MCL | 1.4 (2.7) | 1.4 (1.5) | 1.3 (1.5) | 1.1 (1.5) |
| 25.0% | 628MCL | 1.7 (3.6) | 1.7 (1.8) | 1.5 (1.8) | 0.9 (1.2) |
| | 638MCL | 2.7 (5.3) | 2.7 (3.0) | 2.6 (3.0) | 1.3 (1.8) |
| 50.0% | 628MCL | | 3.4 (3.6) | 3.4 (3.6) | 1.8 (2.5) |
| | 638MCL | | 5.2 (5.9) | 5.2 (5.9) | 2.7 (3.6) |
| 100.0% | 628MCL | | | | 2.9 (4.8) |
| | 638MCL | | | | 3.5 (6.9) |

Values inside () indicate peak values, and values outside () indicate mean values.

• Conditions

Voltage: 7.2 V

Head resistance: 169Ω (176Ω - 3%)

Ambient temperature: 25°C

Paper: Standard paper (equivalent to PD150R)

Printing density: Applied dots are assumed to be evenly distributed.

- The average current increases at the low temperature (under about 5℃) for the print density correction.
- According to the rate of printing, the number of head division drives is changed at the time of a printing automatic division mode setup, and it suppresses peak current automatically. The number of the maximum simultaneous turning-on-electricity dots in this case is 64 dots, and a peak current value is 2.5A. (In addition, voltage and resistance conditions are the same as the above.)

## 5.1.2 Driving Motor

Printer Motor

Voltage: 4.2V～8.5V(628/638MCL without cutter)
4.75V～8.5V(628MCL with cutter) 7.2V～8.5V(638MCL with cutter)

Current: 628MCL4XX :0.9A (max)
638MCL4XX :1.0A (max)

Cutter Motor (with cutter)

Voltage: 4.75V～8.5V(628MCL with cutter) 7.2V～8.5V(638MCL with cutter)

Current: 1.1A (max)

The maximum current in case a cutter motor and a paper conveyance motor drive simultaneously on an interface board with a cutter drive circuit is 1.5A.

## 5.1.3 Logic

Voltage: 5V ± 5%

Current: 0.3A (max)

## 5.2 Operating Environment

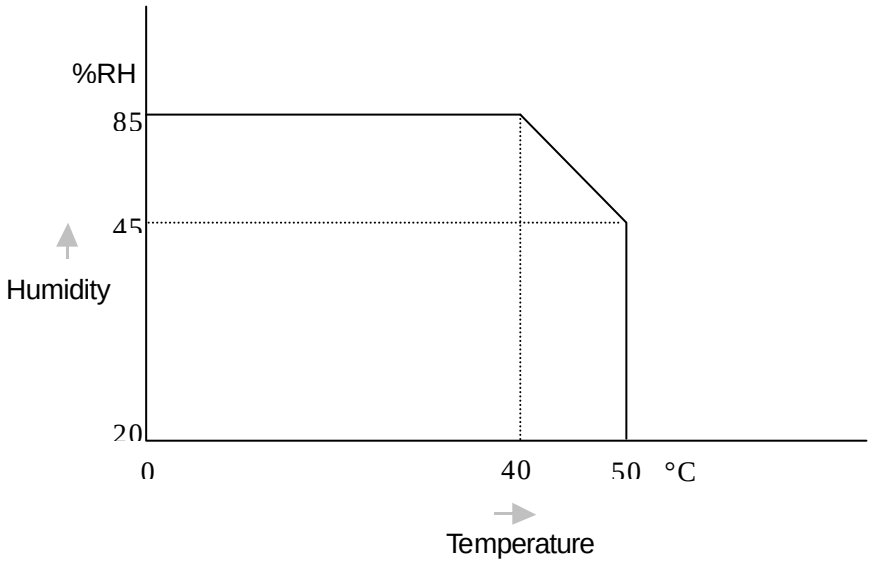
| | | |
|---|---|---|
| During Operation | Operating Temperature | 0~ 50°C |
| | Operating Humidity | 20 ~ 85% RH (no condensation) |
| During Stopping | Storage Temperature | -20 ~ 60° C |
| | Storage Humidity | 5 ~ 90%RH (no condensation) excluding thermo sensitive paper |

**Note 1)**

When printing is continued under high temperature conditions, the printer may enter off-line status automatically because of the temperature rise of the head, and stop printing (head temperature abnormality). When the head temperature drops to normal, the printer automatically returns to on-line status and continues printing.

**Note 2)**

Relation between temperature and humidity in printing is as follows.



5.2.1 Noise

Less than 60 db (at a point 1m above from the printing mechanism position level)

5.2.2 Life

Head life

Electric life: $1x10^8$ pulses

Wear life: 50km

[Condition]

Using paper: PD150R

Temperature: 25°C

Printing duty: 12.5%

## 1 Centronics Interface Specification

### 1.1 General Specification

| | |
|---|---|
| (1) System: | 8-bit parallel interface |
| (2) Maximum data receiving speed | about 28,000byte/sec |
| (3) Synchronous system: | By external strobe pulse (/PRSTB) |
| (4) Handshake: | by BUSY _ /ACKNLG signal |
| (5) Input/Output level: | C-MOS level |

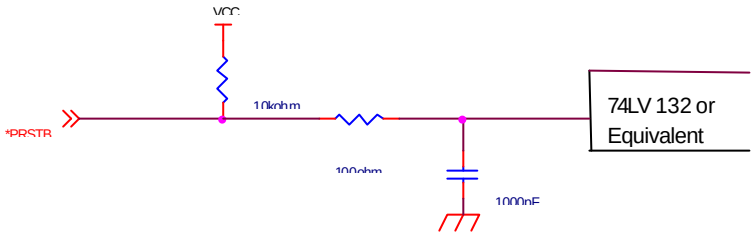
### 1.2 Electrical Characteristics of Input/Output signals

(1) Signal level (for Output)

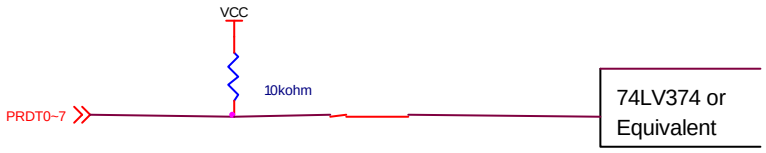
"L": ±0.0 ~ 0.3 x Vcc

"H": 0.7 x Vcc ~ Vcc

(2) Input conditions (/PRSTB)



(3) Input condition (PRDT0~7)



(4) Input condition (/SLCTIN,/ATF)

1.3 Pin Configuration of Input/Output Signals

(1) Connector number: CN1

(2) Connector type: SM30B-SRDS-G-TF(LF)(SN) [made by JST]

(3) Connector Pin Configuration

| No. | Signal name | Data direction | No. | Signal name | Data direction |
|---|---|---|---|---|---|
| 1 | /PRSTB | Input | 2 | /PRSTB-RET | --- |
| 3 | PRDT0 | Input | 4 | PRDT0-RET | --- |
| 5 | PRDT1 | Input | 6 | PRDT1-RET | --- |
| 7 | PRDT2 | Input | 8 | PRDT2-RET | --- |
| 9 | PRDT3 | Input | 10 | PRDT3-RET | --- |
| 11 | PRDT4 | Input | 12 | PRDT4-RET | --- |
| 13 | PRDT5 | Input | 14 | PRDT5-RET | --- |
| 15 | PRDT6 | Input | 16 | PRDT6-RET | --- |
| 17 | PRDT7 | Input | 18 | PRDT7-RET | --- |
| 19 | /ACKLNG | Output | 20 | /ACKLNG-RET | --- |
| 21 | BUSY | Output | 22 | BUSY-RET | --- |
| 23 | RINF2 | Output | 24 | /INPRM-RET | --- |
| 25 | /SLCTIN | Input | 26 | /INPRM | Input |
| 27 | RINF1 | Output | 28 | RINF3 | Output |
| 29 | /ATF | Input | 30 | GND | --- |

**NOTE1)**

A signal with an "/" indicates a negative logic signal.

**NOTE2)**

"-RET" signals are all connected to GND.

**NOTE3)**

Input/output directions indicate directions from the printer.

**NOTE4)**

The connector type is an BM30B-SRDS-G-TFC(LF)(SN) [made by JST] equivalent product. For the connector at other side, use an SHDR-30V-S-B [made by JST] equivalent product.

1.4 Recommended Cable Specifications

Wire: More than AWG28-30 or equivalent

Cable length: 1.0m or less (twisted cable)

1.5 Descriptions of Input Signals

| Signal Name | Function |
|---|---|
| PRDT0~7 | 1) Input signals of 8-bit parallel data.<br>2) “High” indicates that data exists (=1); “Low” indicates no data (=0).<br>3) PRDT0 is the least significant bit (LSB); PRDT7 is the most significant bit (MSB). |
| /PRSTB | 1) Strobe signal to read PRDT0~7.<br>2) Normally “High”. Data is latched when “High” changes to “Low”. |
| /INPRM | 1) Signal to initialize printer<br>2) Normally "High". A hardware reset is executed when "Low" changes to "High".<br>3) This signal sets the printer status as follows.<br>(1) Print buffer — Clear<br>(2) Line feed pitch — About 3.25mm<br>(3) ANK character pitch — 12dots / character<br>(4) Print character type — 12x24 dots half size character<br>(5) Page length setting — 44 lines, about 143 mm<br>(6) Double width specification — Clear<br>(7) Double height specification — Clear<br>(8) Black and white reversal printing — Clear<br>(9) Reverse order printing — Clear<br>(10) Character code — Set to Japanese characters<br>(11) International character setting — Japan<br>(12) Printing speed setting — High-speed mode<br>(13) Horizontal tab setting — Every 8 characters<br>(14) Mark detection to start point setting — About 2 mm<br>(15) Paper run out detection setting — Valid *1<br>(16) Platen open detection setting — Valid *1<br>(17) Temperature abnormality detection setting — Valid *1<br>(18) Near end detection setting — Invalid *1<br>(19) Voltage abnormality detection setting — Valid *1<br>(20) Paper type — Continuous paper<br>(21) Kanji print mode specification — Clear<br>(22) Print quality setting — Standard paper<br>(23) x4 size print mode specification — Clear<br>(24) Kanji code setting — JIS code<br>(25) 90° character rotation — Clear<br>(26) Paper auto-feed amount setting — 20mm<br>(27) Motor off-time setting — One excitation time = 0.5 sec<br>Excitation holding time = 1sec<br>(28) Printing mode setting — Line printing mode<br>*1: This can be set to invalid by the /SLCTIN signal.<br>4) If the /ATF signal in "Low" status is initialized by this signal, the test function mode is set.<br>5) Only initialization is executed without printing data in the buffer. |

CUST.

FUJITSU COMPONENT LIMITED

SHEET 20/

| Signal Name | Function |
|---|---|
| /ATF | 1) Paper feed request signal<br>2) Normally "High". Paper is fed in "Low" status.<br>3) When paper is fed by this signal, the internal processing time is not constant. Use the line feed command for a more accurate paper feed.<br>4) When this signal is received, a line feed is executed by setting the BUSY signal to “High”. If an error dose not occur after a line feed, the BUSY signal becomes “Low”, and the printer enters data receive enable status.<br>5) When paper is fed by receiving this signal, the position on the page does not change. If paper is fed by the new page command after paper is fed by this signal, the page start position deviates.<br>6) If this signal in "Low" status is initialized by the /INPRM signal or the power supply is turned on, the test function mode is set. |
| /SLCTIN | 1)Signal that makes the detection functions of initial setting invalid<br>2) If power is turned ON or if initialization by the /INPRM signal is executed when this signal is "Low", paper run out detection, paper near end, platen open detection, head temperature abnormality detection, motor temperature abnormality detection, head driving voltage abnormality detection and paper feed by /ATF signal become invalid. |

1.6 Description of Output Signals

| Signal Name | Function |
|---|---|
| /ACKNLG | 1) Reply signal to /PRSTB signal.<br>2) Negative logic pulse signal, which is output when data input completes. |
| BUSY | 1) Indicates that printer busy, which means that data cannot be received.<br>2) This signal is "High" when receiving data, printing, feeding paper, and when in error status and in initialization operation. |
| RINF1~3 | 1) This signal indicates the error status of the printer.<br>2) The following table shows each error status. |

| | Error status | RINF1 | RINF2 | RINF3 |
|---|---|---|---|---|
| a. | Paper run out | Low | High | Low |
| b. | Paper near end | High | High | Low |
| c. | Platen open | High | Low | Low |
| d. | Head Temperature abnormality | High | Low | High |
| e. | Head voltage abnormality | Low | High | High |
| f. | Hardware abnormality | High | High | High |
| g. | Mark detection abnormality | Low | Low | Low |
| h. | Normal | Low | Low | High |

3) Each error status is output in the following status.
   a. Paper run out is detected and printer is in off-line status.
   b. Paper near end is detected.
   c. Platen open is detected and printer is in off-line status.
   d. Head temperature abnormality is detected and printer is in off-line status.
   e. Head driving-voltage is not in that 『Depends on cases of that 628/638MCL without cutter：About3.57V～9.78V, 628MCL with cutter：About 4.2V～9.78V, 638MCL with cutter：About6.8V～9.78V』 *1) range.
   f. The following hardware abnormalities are detected.
      - Internal RAM abnormality
      - Watch-dog is occurred
      - Thermo run away of head
      - MCU is in hardware-reset status.
      - Disconnect of head cable
      - Cutter abnormality (Only it can return from hardware abnormality state by motion of platen open-close.)
   g. Printer is in the following status.
      - Mark is not detected within page
      - During printer initialization
   h. Normal status
4) Error detection priority
   Hardware > head voltage > head temperature > paper run out > platen open > mark undetected > near end > normal

*1) Since there is fear of breakage of a head, be sure to use head voltage less than **8.5V** .

# 2 RS-232C Interface Specification

## 2.1 General Specification

| | | |
|---|---|---|
| 2) | System: | Serial interface |
| 3) | Data receiving speed: | 19200,9600,4800,2400 bps (selected by dip switch) |
| 4) | Synchronous system: | Start-Stop synchronous system, full duplex communication |
| 5) | Handshake: | by DTR/DSR signal or XON/XOFF (selected by dip switch) |
| 6) | Input/Output level: | RS-232C level |

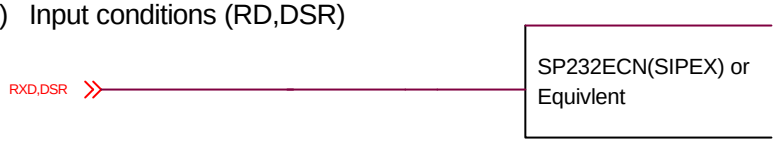
## 2.2 Electrical Characteristics of Input/Output signals

(1) Signal level (for Output)

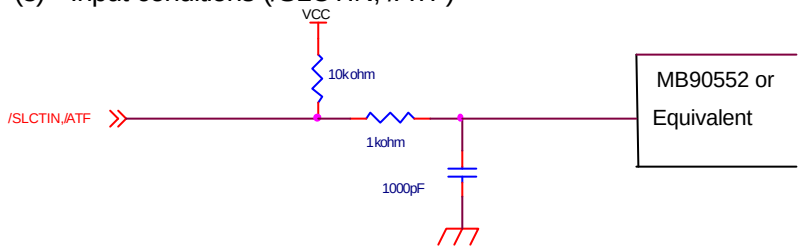
Space (logic=0): +3V ~ +12V

Mark (logic=1): -3V ~ -12V

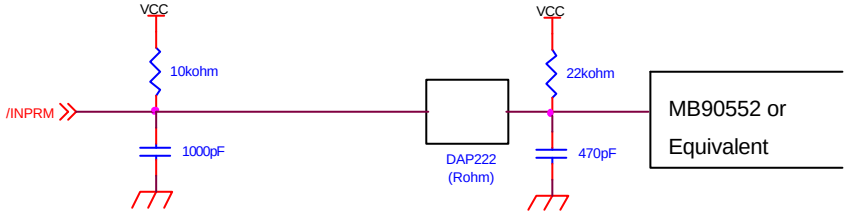
(2) Input conditions (RD,DSR)



(3) Input conditions (/SLCTIN, /ATF)



(4) Input condition (/INPRM)



(5) Output Conditions (TD, DTR)

SHEET 23

2.3 Communication Format

(1) XON / XOFF control: Communication is controlled by what remains in the receive buffer. (XOFF is sent when what remains is 10 bytes or less, then XON code is sent when what remains becomes 20 bytes or more.) This is invalid when DSR / DTR is selected by dipswitch.

(2) Receive buffer length: 45 bytes / 4096 bytes (selected by dip switch)

(3) Receive error processing: When a receive error occurs (ex. parity, flaming) this data is ignored and printing restarts from the next data.

2.4 Pin Configuration of Input/Output Signals

(1) Connector number: CN2

(2) Connector type: S8B-ZR-SM4A-TF(LF)(SN) [made by JST]

(3) Connector Pin Configuration

| № | Signal Name | Direction | Function |
|---|---|---|---|
| 1 | RXD | Input | Receive data |
| 2 | TXD | Output | Transmission data |
| 3 | DTR | Output | Data terminal ready |
| 4 | GND | --- | Signal ground |
| 5 | DSR | Input | Data set ready |
| 6 | /SLCTIN | Input | Detection setting invalid signal |
| 7 | /INPRM | Input | Initialize request signal |
| 8 | /ATF | Input | Paper feed request signal |

**NOTE1)**

Input/Output directions indicate directions from printer.

**NOTE2)**

For the connector of the other side, use an ZHR-8 [made by JST] equivalent product.

2.5 Recommended Cable Specifications

Wire: More than AWG28 or equivalent

Cable length: 15m or less (Shield cable)

DOCUMENT CONTROL SECTION

DATE

## 2.6 Description of Signals

| Signal Name | Function |
|---|---|
| RXD | (1) Serial data input signal. Data signal to be transferred from host to printer.<br>(2) "Space" indicates no data (= 0), "Mark" indicates that data exists (= 1).<br>(3) The data format is as follows.<br><br>Start \| b0 \| b1 \| b2 \| b3 \| b4 \| b5 \| b6 \| b7 \| Parity \| Stop<br><br>Note *1) Length of stop bit is 1 bit fixed.<br>Note *2) With/without parity (odd) can be selected by dipswitch.<br>Note *3) Data length setting is 8 bits.<br><br>(4) Start bit is "Space" and stop bit is "Mark".<br>(5) Communication speed setting (19200,9600,4800,2400bps) can be selected by dipswitch. |
| TXD | (1) Serial data output signal. Data signal to be transferred from printer to host.<br>(2) When XON/XOFF control is selected by dipswitch, XOFF code (13H) is sent in data receive disabled status. XON code (11H) is sent to host when printer returns to data receive enable status.<br>(3) Other functions are the same as RXD. |
| DTR | (1) Output signal to indicate that printer is in data receive enable status.<br>(2) "Space" indicates data receive enable status, "Mark" indicates data receive disable status.<br>(3) If data is sent from host when this signal is "Mark", an error occurs and data is ignored.<br>(4) "Mark" is output during initialization, receive buffer full status and when an abnormality is detected. When XON / XOFF control is set by dipswitch, "Mark" is output only during initialization. |
| DSR | (1) Input signal to indicate that printer is in data transmission enable status.<br>(2) When this signal is "Space", printer judges the status as data transmission enable, and sends data to host. When this signal is "Mark", printer does not send data.<br>(3) When XON/XOFF control is set by dipswitch, printer ignores this signal and sends data. |
| /ATF | (1) Paper feed request signal.<br>(2) Normally "High". Paper is fed in "Low" status.<br>(3) When paper is fed by this signal, the internal processing time is not constant. Use the line feed command for a more accurate paper feed.<br>(4) When paper is fed by this signal, when XON/XOFF control is set by dipswitch signal XOFF code is sent, when DTR/DSR control is set DTR becomes “Mark”.<br>(5) When paper is fed by receiving this signal, the position on the page does not change. If paper is fed by the new page command after paper is fed by this signal, the page start position deviates.<br>(6) If this signal in "Low" status is initialized by the /INPRM signal or the power supply is turned on, the test function mode is set. |
| /SLCTIN | (1) Signal that makes the detection functions of initial setting invalid<br>(2) If power is turned ON or if initialization by the /INPRM signal is executed when this signal is "Low", paper run out detection, paper near end, platen open detection, head temperature abnormality detection, motor temperature abnormality detection, head driving voltage abnormality detection and paper feed by /ATF signal become invalid. |

DOCUMENT CONTROL SECTION

DATE

| Signal Name | Function |
|---|---|
| /INPRM | (1) Signal to initialize printer<br>(2) Normally "High". A hardware reset is executed when "Low" changes to "High".<br>(3) This signal sets the printer status as follows. |

| | |
|---|---|
| (1) Print buffer | Clear |
| (2) Line feed pitch | About 3.25mm |
| (3) ANK character pitch | 12dots / character |
| (4) Print character type | 12x24 dots half size character |
| (5) Page length setting | 44 lines, about 143 mm |
| (6) Double width specification | Clear |
| (7) Black and white reversal printing | Clear |
| (8) Reverse order printing | Clear |
| (9) Character code | Set to Japanese characters |
| (10) International character setting | Japan |
| (11) Printing speed setting | High-speed mode |
| (12) Horizontal tab setting | Every 8 characters |
| (13) Mark detection to start point setting | About 2 mm |
| (14) Paper run out detection setting | Valid *1 |
| (15) Platen open detection setting | Valid *1 |
| (16) Temperature abnormality detection setting | Valid *1 |
| (17) Near end detection setting | Invalid |
| (18) Voltage abnormality detection setting | Valid *1 |
| (19) Paper type | Continuous paper |
| (20) Kanji print mode specification | Clear |
| (21) Kanji code setting | JIS code |
| (22) Double height specification | Clear |
| (23) x4 size print mode specification | Clear |
| (24) Print quality setting | Standard paper |
| (25) 90° character rotation | Clear |
| (26) Paper auto-feed amount setting | 20mm |
| (27) Motor off-time setting | One excitation time = 0.5 sec<br>Excitation holding time = 1sec |

*1: This can be set to invalid by the /SLCTIN signal.

(4) If the /ATF signal in "Low" status is initialized by this signal, the test function mode is set.
(5) Only initialization is executed without printing data in the buffer.
(6) During initialization, DTR outputs “Mark”. After initialization end if an error does not occur, when XON/XOFF control is set by dipswitch signal XON code is sent, when DTR/DSR control is set DTR becomes “Space”. After initialization end if an error occurs, when XON/XOFF control is set by dipswitch XOFF code is sent, when DTR/DSR control is set DTR keeps “Mark”.

## 1.2 Detection Function

| Detection Function | Function |
|---|---|
| Paper Run Out Detection | (1) During printing or feeding paper, a paper run out is detected when the sensor continuously detects a black level for about 7mm.<br>(2) When the printer detects a paper run out during printing, and if currently printing data exists, the printer automatically enters off-line (BUSY) status after printing one line.<br>(3) Set the paper. If an error has not occurred, one line is fed and printing restarts from the next line.<br>(4) When paper run out detection invalid mode is set by the detection function setting command or the /SLCTIN signal, paper run out is not detected.<br>(5) When paper run out status is detected in paper run out detection valid mode, paper cannot be fed by command, but can be fed by the /ATF signal.<br>(6) When paper run out is detected, driving of the motor is turned OFF.<br>(7) When the connector for detection is in open status, it is judged as a paper run out. |
| Paper Near End Detection | (1) When the near end detection signal (/NES) becomes about 1.5V or less, it is judged as paper near end. In this status, data receiving and printing are executed continuously.<br>(2) When the connector for detection is in open status, it is judged as paper near end.<br>(3) When power is turned ON and at initialization, this function is invalid, and can be valid by the detection function setting command. |

| Detection Function | Function |
|---|---|
| Platen Open Detection | (1) When the printer detects platen open during printing, the printer stops driving the head and the motor in one line unit, and the printer automatically enters off-line (BUSY) status.<br>(2) Move the platen close. If an error has not occurred, one line is fed and printing restarts from the next dot line after that (the home positioning initialization of a cutter when the cutter is mounted , new one-line feeding When the ATR signal are set as "High")etc. At this time printing continuity is not guaranteed.<br>(3) When the platen open detection invalid mode is set by the detection function setting command or by the /SLCTIN signal, platen open is not detected.<br>(4) When platen status is detected in platen detection valid mode, paper cannot be fed by command, but can be fed by the /ATF signal.<br>(5) When platen open is detected, driving the motor is turned OFF. |
| Thermal Head Temperature Abnormality Detection | (1) Temperature is detected by the thermistor inside the thermal head to protect the head from heating.<br>(2) When abnormal temperature (about 70℃) is detected, the printer stands by in busy status until the temperature drops to the specified temperature (about 60℃).<br>(3) When the temperature abnormality detection invalid mode is set by the detection function setting command or by the /SLCTIN signal, abnormal temperature is not detected.<br>(4) When temperature abnormality is detected in temperature abnormality detection valid mode, paper cannot be fed by command.<br>(5) When the temperature of the thermal head returns to printing enable status and an error has not occurred, the printer immediately returns to normal status. |
| Voltage Abnormality Detection | (1) Printing head drive voltage is detected, when this voltage 『Depends on cases of that 628/638MCL without cutter：About3.57V～9.78V, 628MCL with cutter：About 4.2V～9.78V, 638MCL with cutter：About6.8V～9.78V』 * is abnormality, the printer automatically enters off-line status.<br>(2) When power-supply voltage 『Depends on cases of that 628/638MCL without cutter：About3.78V～9.35V, 628MCL with cutter：About 4.5V～9.35V, 638MCL with cutter：About7.2V～9.35V』 * returns within the above-mentioned range and an error has not occurred, the printer immediately returns to normal status.<br>(3) When the voltage abnormality detection invalid mode is set by the detection function setting command or by the /SLCTIN signal, abnormal voltage is not detected.<br>*Caution：Since there is fear of breakage of a head, be sure to use head voltage less than **8.5V** . |

## 2.2 Detection Function

| Detection Function | Function |
|---|---|
| Paper Run Out Detection | (1) During printing or feeding paper, a paper run out is detected when the sensor continuously detects a black level for about 7mm. If "XON/XOFF" flow is selected, "XOFF" code is transmitted. If "DTR/DSR" flow is selected, "DTR" signal goes to "mark" state.<br>(2) When the printer detects a paper run out during printing, and if currently printing data exists, the printer automatically enters off-line (BUSY) status after printing one line.<br>(3) Set the paper. If an error has not occurred, one line is fed and printing restarts from the next line. If "XON/XOFF" flow is selected, "XON" code is transmitted. If "DTR/DSR" flow is selected, "DTR" signal goes to "space" state.<br>(4) When paper run out detection invalid mode is set by the detection function setting command or the /SLCTIN signal, paper run out is not detected.<br>(5) When paper run out status is detected in paper run out detection valid mode, paper cannot be fed by command, but can be fed by the /ATF signal.<br>(6) When paper run out is detected, driving of the motor is turned OFF.<br>(7) When the connector for detection is in open status, it is judged as a paper run out. |
| Paper Near End Detection | (1) When the near end detection signal (/NES) becomes about 1.5V or less, it is judged as paper near end. In this status, data receiving and printing are executed continuously.<br>(2) When the connector for detection is in open status, it is judged as paper near end.<br>(3) When power is turned ON and at initialization, this function is invalid, and can be valid by the detection function setting command. |

| Detection Function | Function |
|---|---|
| Platen open Detection | (1) When the printer detects platen open during printing, the printer stops driving the head and the motor in one line unit, and the printer automatically enters off-line (BUSY) status. If "XON/XOFF" flow is selected, "XOFF" code is transmitted. If "DTR/DSR" flow is selected, "DTR" signal goes to "mark" state.<br>(2) Move the platen close. If an error has not occurred, one line is fed and printing restarts from the next dot line after that (the home positioning initialization of a cutter when the cutter is mounted , new one-line feeding When the ATR signal are set as "High")etc. At this time printing continuity is not guaranteed. If "XON/XOFF" flow is selected, "XON" code is transmitted. If "DTR/DSR" flow is selected, "DTR" signal goes to "space" state.<br>(3) When the platen open detection invalid mode is set by the detection function setting command or by the /SLCTIN signal, platen open is not detected.<br>(4) When platen open status is detected in platen open detection valid mode, paper cannot be fed by command, but can be fed by the /ATF signal.<br>(5) When platen open is detected, driving the motor is turned OFF. |
| Thermal Head Temperature Abnormality Detection | (1) Temperature is detected by the thermistor inside the thermal head to protect the head from heating.<br>(2) When abnormal temperature (about 70°C) is detected, the printer stands by in busy status until the temperature (about 60°C) drops to the specified temperature.<br>(3) When the temperature abnormality detection invalid mode is set by the detection function setting command or by the /SLCTIN signal, abnormal temperature is not detected.<br>(4) When temperature abnormality is detected in temperature abnormality detection valid mode, paper cannot be fed by command.<br>(5) When the temperature of the thermal head returns to printing enable status and an error has not occurred, the printer immediately returns to normal status. |
| Paper Near End Detection | (1) When the near end detection signal (/NES) becomes about 1.5V or less, it is judged as paper near end. In this status, data receiving and printing are executed continuously.<br>(2) When the connector for detection is in open status, it is judged as paper near end.<br>(3) When power is turned ON and at initialization, this function is invalid, and can be valid by the detection function setting command. |
| Cutter Abnormality Detection | (1) When cutting does not end, a Cutter abnormality is detected as a cutter defect, and the printer automatically enters off-line status. If "XON/XOFF" flow is selected, "XOFF" code is transmitted. If "DTR/DSR" flow is selected, "DTR" signal goes to "mark" state.<br>(2) The printer returns by turning power on again or by hardware reset processing.<br>(3) When the cutter blade is not in the home position at initialization, the printer automatically positions the cutter.<br>(4) When a paper cut command is received in the state of cutter un-connecting, it will be in a Hardware abnormality state. |
| Thermal Head Critical Temperature Abnormality Limit Detection | (1) When abnormal limit critical temperature (about 90°C) of thermal head is detected, the printer will be in a Hardware abnormality state.<br>(2) Thermal head critical temperature limit detection cannot be invalid by the /SLCTIN signal. |

FUJITSU COMPONENT LIMITED

# SECTION G

## Commands Specification

Each command is explained using the following conventions:

[Name] Command name

[Function] Function of command

[Code] Control code represented in hexadecimal or decimal notation.

$[X]_{16}$ Hexadecimal notation

$[X]_{10}$ Decimal notation

[Explanation] Explanation of command function

DOCUMENT CONTROL SECTION

DATE

## (1) HT

[Name] Horizontal tab

[Function] The HT command moves the printing position to the next horizontal tab position.

[Code] $[09]_{16}$
$[09]_{10}$

[Explanation]

(1) If the next horizontal tab position is not set, the HT command is ignored.

(2) If the next horizontal tab position is outside the printing area, the printing position is shifted to the proper position by adding 1 to the printing area width.

(3) If an HT command is received when the print head is located at the position to which the printing has been newly shifted by adding 1 to the printing area width, buffer-full printing is executed. Then, the horizontal tab operation is executed from the head of the next line.

(4) The horizontal tab position is set with *ESC D*.

(5) If characters are received when the print head is located at the position to which the printing has been shifted by adding 1 to the printing area width, buffer-full printing is executed. Then, the print head moves to the leftmost column on the next line, and the received characters are processed. When a line feed command such as LF is received, data is printed and a line is fed. The print head then moves to the leftmost column on the next line.

(6) In backward printing, the tab indicates a position from the rightmost column.

## (2) LF

[Name] Line feed

[Function] The LF command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next line.

[Code] $[0A]_{16}$
$[10]_{10}$

[Explanation]

(1) The *LF* command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next line.

(2) In the initial state, the line spacing is set to approx. 1/8 inch.

(3) When there is no data in the print buffer, only a line feed operation is executed.

(4) When different-height character typefaces are to be printed on the same line, these character typefaces are arranged so that their bottom ends are aligned at the same level.

(5) If line spacing during printing/line-feeding is shorter than the character height, a length equal to the character height feeds the paper.

## (3) FF

[Name] Forms feed (new page)

[Function] The *FF* command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next page.

[Code] $[0C]_{16}$
$[12]_{10}$

[Explanation]

(1) The *FF* command feeds paper by the specified page length.

(2) In the initial state, the page length is set to approx. 143 mm. (44 lines).

(3) When cut-sheet printing is selected, the *FF* command executes the following operations:

- When the page length is set to 0 (page length cancellation) by using *ESC C*, the paper is ejected.
- Paper ejection is checked using the paper-out sensor. When the detection is invalid, the paper ejection is checked.
- The maximum paper ejection length is approx. 1m. If the paper-out state is not detected within the span of the 1-meter ejection, the paper ejection terminates.

(4) When paper with mark is selected, the *FF* command executes the following operations:

- The data contained in the print buffer is printed, and a search is made for the head of the next label.
- The beginning of a line is set as the next printing position.
- A paper with mark is selected with *ESC c1*.

## (4) DC 2

[Name] Power down

[Function] When it receives this command, the printer switches to power down mode.

[Code] $[12]_{16}$
$[18]_{10}$

[Explanation]

(1) When receiving this code, the printer switches to power down mode.

(2) If the printer buffer contains data, the prints the data before switching to power down mode. If the print buffer contains no data, the printer immediately switches to power down mode.

(3) When level of /SLCTIN or /ATF signal become “low”, power down mode is canceled.

(4) If this code is received during printing, the printer switches to power down mode up on completion of the operation.

(5) This code is invalid in bit image print mode.

## (5) ESC EM + n

[Name] Setting the amount of the feeding at automatic paper feed

[Function] The amount of the feeding at automatic paper feeding is set.

[Code] $[1B]_{16}$ $[19]_{16}$ [n]
$[27]_{10}$ $[25]_{10}$ [n]

[Explanation]

(1) The amount of feeding is set by this command.

(2) The set amount of feeding is 2x n dot line.

(3) The range of n is $0 \leqq n \leqq 255$. The automatic paper feed function becomes invalid for n=0.

(6) At the time of power ON or reset, the printer is set the continuous paper mode with automatic paper feeding.

(7) An initial value is n = 80. (About 20mm)

## (6) ESC RS

[Name] Black-white reversed printing specification

[Function] The *ESC RS* command specifies black-white reversed printing.

[Code] $[1B]_{16}$ $[1E]_{16}$
$[27]_{10}$ $[30]_{10}$

[Explanation]

(1) The *ESC RS* command specifies black-white reversed printing.

(2) The *ESC RS* command can be specified in units expressed in characters. One line can contain both normal printed characters and reverse printed characters.

(3) The *ESC RS* command can be used in all character modes.

(4) The *ESC RS* command can also be used in bit image printing.

(5) The line-spacing area is not appeared in reverse format.

(6) When a printing start command (*LF* or *FF*) is received in reverse mode, some of the print image is not appear in reverse format. This reverse suppression continues from the reverse mode specified character to the rightmost column (in forward printing mode) or to the leftmost column (in backward printing mode).

(7) The print image of the characters skipped with a *HT* command is not appear in reverse format.

## (7) ESC US

[Name] Black-white reversed printing cancellation

[Function] The *ESC US* command cancels black-white revered printing.

[Code] $[1B]_{16}$ $[1F]_{16}$
$[27]_{10}$ $[31]_{10}$

[Explanation]

(1) The *ESC US* command cancels the reverse printing mode.

(2) The *ESC US* command does not start character printing.

## (8) ESC ! + n

[Name] Printing mode specification

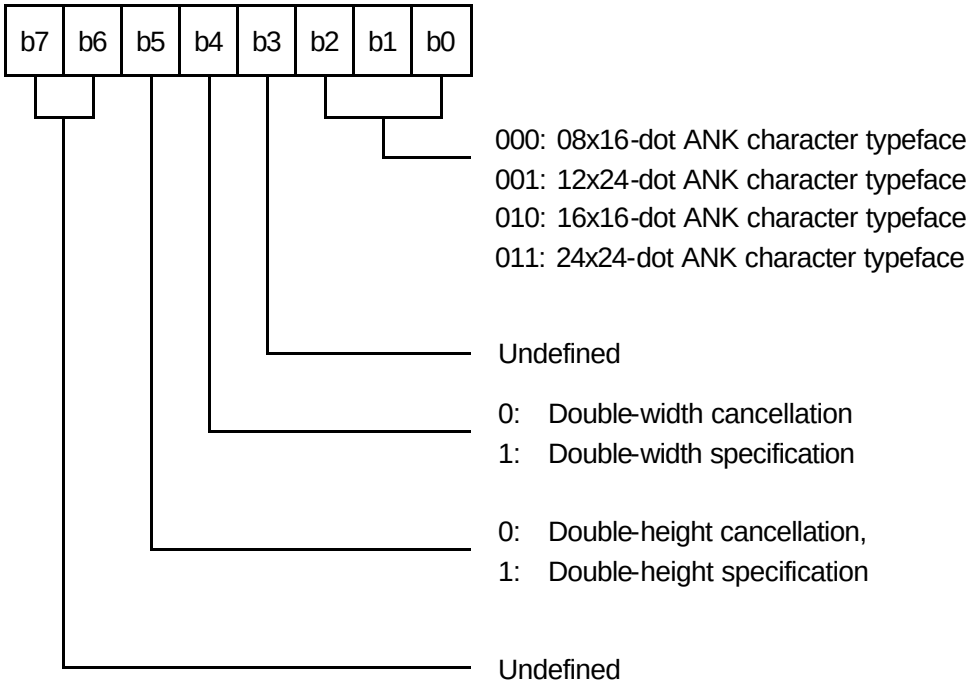
[Function] The ESC ! + n command specifies printing mode.

[Code] $[1B]_{16}$ $[21]_{16}$ [n]
$[27]_{10}$ $[33]_{10}$ [n]

[Explanation]

(1) The *ESC ! + n* command specifies printing mode.

(2) The following figure shows the relationship between the bits of parameter n and printing mode:



(3) When both the double width and double height are specified, characters with the double height and width character typeface are printed.

(4) When one line contains different-height character typefaces, the character typefaces are arranged so that their bottom ends are aligned at the same level.

## (9) ESC % + n

(effect only when Flash Memory or SRAM mounted)

[Name] External registration character specification/cancellation

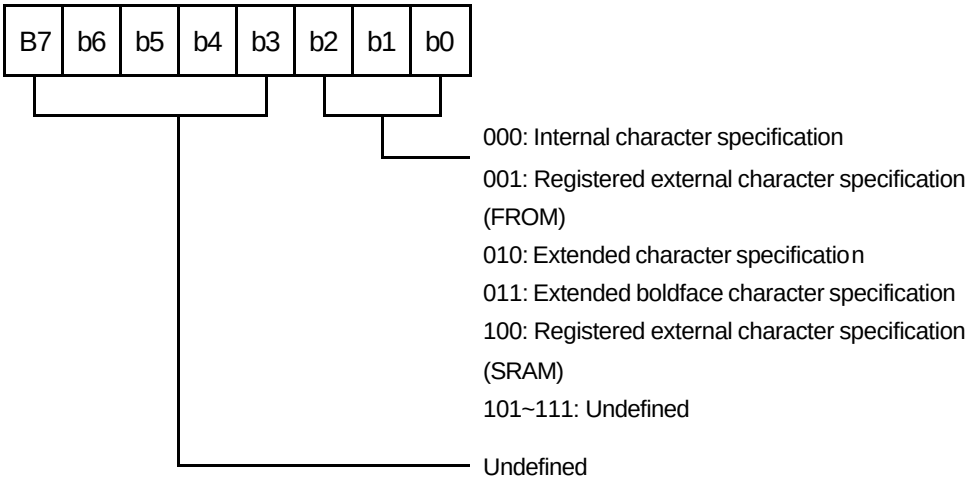
[Function] The ESC % + n command specifies or cancels registered external characters.

[Code] $[1B]_{16}$ $[25]_{16}$ [n]
$[27]_{10}$ $[37]_{10}$ [n]

[Explanation]

(1) The *ESC %+n* command selects an internal character set (system-defined font) or a registered external character set (user-defined font).

(2) The following figure shows the relationship between the bits of parameter n and the character set to be selected:



(3) One of the following character sets is selected with the character type selected with the *ESC !* command:

| No. | *ESC !* Specification | Registered External Character Specification | Extended Character Specification | Extended Boldface Character Specification |
|---|---|---|---|---|
| 1 | 08 x 16 ANK | 08 x 16 registered | 08 x 16 extended | 08 x 16 boldface |
| 2 | 12 x 24 ANK | 12 x 24 registered | 12 x 24 extended | 12 x 24 boldface |
| 3 | 16 x 16 ANK | 16 x 16 registered | 16 x 16 extended | Undefined |
| 4 | 24 x 24 ANK | 24 x 24 registered | 24 x 24 extended | Undefined |

(4) If an undefined external character code is received when the registered character-printing mode is set, the corresponding internal character is printed.

## (10) ESC & + y + n + m + x + $d_1$ to $d_n$

(Effect only when Flash Memory mounted)

[Name] External registration character definition

[Function] The ESC & + y + $c_1$ + $c_2$ + x + $d_1$ to $d_n$ command defines external characters to be registered.

[Code] $[1B]_{16}$ $[26]_{16}$ [y] [$c_1$] [$c_2$] [x] [$d_1$] to [$d_n$]
$[27]_{10}$ $[38]_{10}$ [y] [$c_1$] [$c_2$] [x] [$d_1$] to [$d_n$]

[Explanation]

(1) This *ESC* command defines external characters to be registered.

(2) The memory for External registration character specification by value of parameter y is chosen. if y value outside of the range is chosen, it becomes a parameter error.

| y | Registration external Memory |
|---|---|
| O | Flash Memory |
| 1 | SRAM |

(3) Parameter x specifies a dummy code. A NUL code must be specified.

(4) Parameter d specifies the data to be defined.

(5) Parameter $c_1$ and $c_2$ specify the areas to be defined. The values of parameter $c_1$ and $c_2$ values must satisfy the following conditions:$[20]_{16} \leqq c_1 \leqq c_2 \leqq [FF]_{16}$

(8) To define one character, parameter $c_1$ and $c_2$ must be specified so that the $c_1$ value is equal to the $c_2$ value. To define two or more characters, the data block of $d_1$ to $d_n$ must be specified the same number of times as the number of characters to be defined.

(9) If "$c_2 < c_1$" is detected, a parameter error is assumed and the external characters are not registered.

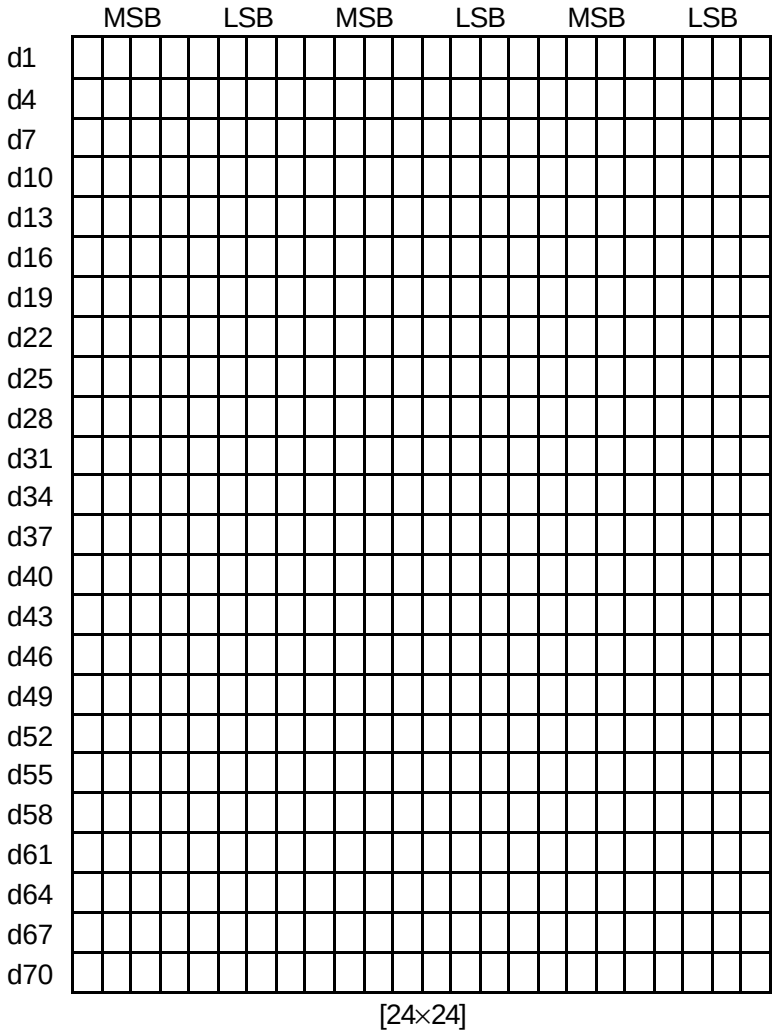
(10)The length of the data required to define one external character to be registered depends on the character type specified with the *ESC !* command (see the following table):

| Character type specified with *ESC !* | Data length |
|---|---|
| 08 x 16 ANK | 16 bytes |
| 12 x 24 ANK | 48 bytes |
| 16 x 16 ANK | 32 bytes |
| 24 x 24 ANK | 72 bytes |

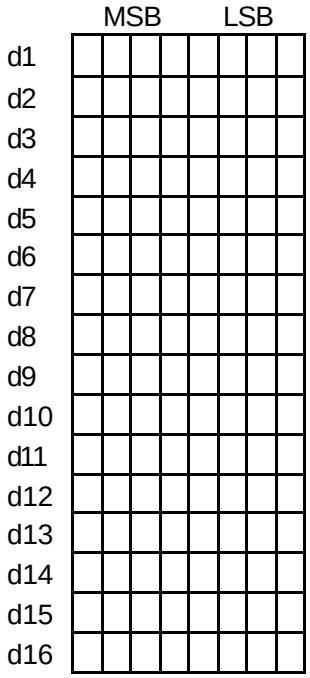
DOCUMENT CONTROL SECTION

DATE

(11) The character-typeface definition data must use the following formats:



[24×24]



[8×16]

## (11) ESC * + m + $n_1$ + $n_2$ + $d_1$ to $d_n$

[Name] Bit image printing

[Function] The ESC * + m + $n_1$ + $n_2$ + $d_1$ to $d_n$ command specifies and prints a bit image.

[Code] $[1B]_{16}$ $[2A]_{16}$ [m] [$n_1$] [$n_2$] [$d_1$] to [$d_n$]
$[27]_{10}$ $[42]_{10}$ [m] [$n_1$] [$n_2$] [$d_1$] to [$d_n$]

[Explanation]

(1) This *ESC* command specifies and prints a bit image.

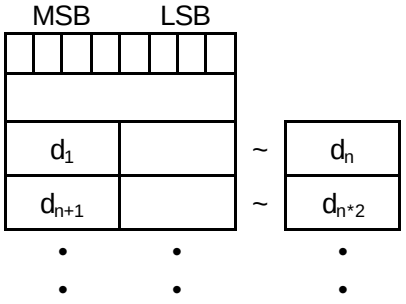
(2) The relationship between parameter m and image print modes is as follows:

| m | Mode | Number of print dots | | Number of dots |
|---|---|---|---|---|
| | | Vertical direction | Horizontal Direction | |
| 97 | Single density | 1 | 16 | ($n_2$*256+$n_1$)*print-width/2 |
| 98 | Double density | 1 | 8 | ($n_2$*256+$n_1$)*print-width |

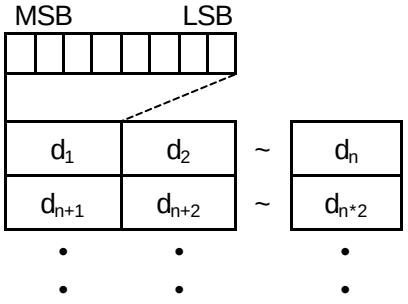
(3) Parameter $n_1$ and $n_2$ specify the number of lines to be printed. Without regard to the specified mode, conditions $0 \leqq n_1 \leqq 255$ and $0 \leqq n_2 \leqq 3$ must be satisfied. If condition $n_1=n_2=0$ is satisfied, a parameter error is assumed and this *ESC* command becomes invalid. Data overflowing from the specified printing area is ignored.

(4) The following figure shows the relationship between bit image data and print data:

- When m = 97



- When m = 98



(5) Parameter $n_1$ and $n_2$ specify the number of dots in the vertical direction of the bit image to be printed. That is, the number of dots is "256 x $n_2$ + $n_1$." Therefore, the number of dots to be transferred is "(256 x $n_2$ + $n_1$) x print-head-width."

(6) The print width is as follows:

| Printer | Print width (bytes) |
|---|---|
| FTP-628MCL | 48 |
| FTP-638MCL | 72 |

DOCUMENT CONTROL SECTION

DATE

## (12) ESC 2

[Name] 1/6-inch line pitch setting

[Function] The ESC 2 command sets the single line pitch to 1/6 inch.

[Code] $[1B]_{16}$ $[32]_{16}$
$[27]_{10}$ $[50]_{10}$

[Explanation]

(1) The *ESC 2* command sets single line pitch to 1/6 inch.

(2) When line pitch is set using the *ESC 2* command, the line spacing set with the *ESC A* command is invalidated.

## (13) ESC 3 + n

[Name] Line pitch setting

[Function] The ESC 3 + n command sets single line pitch.

[Code] $[1B]_{16}$ $[33]_{16}$ [n]
$[27]_{10}$ $[51]_{10}$ [n]

[Explanation]

(1) The *ESC 3 + n* command sets single line pitch to n dot lines.

(2) When line pitch is set using the *ESC 3 + n* command, the line pitch previously set with the *ESC A* command is invalidated.

(3) In line feed with printing, paper is fed by at least the height of the character currently specified. In line feed without printing, paper is fed only by the specified line spacing. For example, when line spacing of 10 dot lines is specified for a character of which height is 24 dot lines, paper is fed by 24 dot lines (in line feed with printing) or 10 dot lines (in line feed without printing).

## (14) ESC ? + n

(effect only when Flash Memory or SRAM mounted)

[Name] External registration character deletion

[Function] The ESC ? + n command deletes an external registration character specified with parameter n

[Code]

| | | | | |
|---|---|---|---|---|
| $[1B]_{16}$ | $[3F]_{16}$ | [n] | | :Flash memory area character deletion |
| $[27]_{10}$ | $[63]_{10}$ | [n] | | |
| $[1B]_{16}$ | $[3F]_{16}$ | [0] | [m] | :SRAM area character deletion |
| $[27]_{10}$ | $[63]_{10}$ | [0] | [m] | |

[Explanation]

(1) Parameter n specifies the deleted character code.

(2) the value of parameter n must satisfy the following condition:
$[20]_{16} \leqq n \leqq [FF]_{16}$

(3) After deletion, the corresponding internal character is printed.

(4) The code definition pattern of the character type specified with the *ESC !* command is deleted.

(5) If an unregistered character code is specified with the *ESC ? + n* command, the *ESC ?+n* command is ignored.

(6) When the value of parameter n is 0. the value of parameter m must satisfy the following condition:
$[20]_{16} \leqq m \leqq [FF]_{16}$

## (15) ESC @

[Name] Printer resetting

[Function] The ESC @ command initializes the printer.

[Code] $[\ 1B\ ]_{16}$ $[\ 40\ ]_{16}$
$[\ 27\ ]_{10}$ $[\ 64\ ]_{10}$

[Explanation]

(1) The *ESC @* command initializes the printer.
(2) The *ESC @* command prints the data contained in the print buffer, and initializes various setup items.

(3) When the *ESC @* command is executed, various setup items are set as follows:

| | | |
|---|---|---|
| 1) | Print buffer | Clear |
| 2) | Line feed pitch | 26dot line |
| 3) | Print character type | 12x24 dots half size character |
| 4) | Double width specification | Clear |
| 5) | Character code setting | Japanese characters |
| 6) | International character setting | Japan |
| 7) | Mark detection to start point setting | About 2 mm |
| 8) | Paper run out detection setting | Valid *1 |
| 9) | Platen open detection setting | Valid *1 |
| 10) | Temperature abnormality detection setting | Valid *1 |
| 11) | Voltage abnormality detection setting | Valid *1 |
| 12) | Kanji print mode specification | Clear |
| 13) | Print quality setting | Standard paper |
| 14) | Kanji code setting | JIS code |
| 15) | Printing speed setting | High speed mode |
| 16) | Receive code buffer | Retained |
| 17) | Horizontal tab setting | Every 8 characters |
| 18) | Black and white reversal printing | Clear |
| 19) | Backward printing specification | Clear |
| 20) | Near end detection setting | Invalid |
| 21) | Feed function | Valid |
| 22) | Paper type | Continuous forms |
| 23) | Registered characters | Clear |
| 24) | Page length setting | 44 lines, about 143 mm |
| 25) | 90° character rotation | Clear |
| 26) | Paper auto-feed amount setting | 20mm |
| 27) | Motor off-time setting | One excitation time : 0.5 sec<br>Excitation holding time : 1sec |

*1: This can be set to invalid by the /SLCTIN signal.

## (16) ESC A + n

[Name] Line spacing setting

[Function] The ESC A + n command sets the line spacing to "n" dot lines.

[Code] $[1B]_{16}$ $[41]_{16}$ [n]
$[27]_{10}$ $[65]_{10}$ [n]

[Explanation]

(1) The *ESC A + n* command sets the line spacing to "n" dot lines.

(2) Condition $0 \leqq n \leqq 255$ must be satisfied. However, when "n + character-height" is 256 dot lines or more, the line spacing is n + character-height - 256.

(3) If the *ESC A + n* command is set two or more times for the same line, the last set line spacing is valid.

(4) When line pitch is set with the *ESC 3* or *ESC 2* command, the line spacing set with the *ESC A + n* is invalidated.

## (17) ESC C + n

[Name] Page length setting

[Function] The ESC C + n command sets the page length to "n" lines.

[Code] $[1B]_{16}$ $[43]_{16}$ [n]
$[27]_{10}$ $[67]_{10}$ [n]

[Explanation]

(1) The *ESC C + n* command sets the page length to "n" lines.

(2) Condition $0 \leqq n \leqq 63$ must be satisfied.

(3) When parameter n specifies 0, the page length is reset. If a *FF* command is received when the cut sheet mode is specified and the page length is reset, the paper is ejected.

(4) If the value of parameter n is incorrect, the page length setting is invalidated and the previous page length is validated.

(5) Even if the line spacing is changed after the page length is set, the page length is not changed.

(6) The line pitch is set as follows:
- When the line spacing is set with *ESC A* command, the line pitch is set with "character-height + line spacing".
- When the line pitch is set with *ESC 2* or *ESC 3* command, the line pitch is set with the line pitch to be set.

## (18) ESC D+d1 to dN+NUL

[Name] Horizontal tab position setting

[Function] The ESC D+d1 to dN+NUL command sets the horizontal tab position.

[Code] $[1B]_{16}$ $[44]_{16}$ [d1] to [dN] $[00]_{16}$
$[27]_{16}$ $[68]_{16}$ [d1] to [dN] $[00]_{10}$

[Explanation]

(1) Condition $1 \leqq d \leqq 255$ must be satisfied.

(2) Condition $1 \leqq N \leqq 32$ must be satisfied.

(3) The horizontal tab position is set to the position that is "d x ank-character-width" distant from the head of the line in the printing area.
When character-width are satisfied to double-width, the horizontal tab position is applied double-character width.

(4) Even if the character width is changed after the horizontal tab position is set, the set horizontal tab position is not changed.

(5) When the horizontal tab is set with the *ESC D+d1 to dN+NUL* command, the horizontal tab position already set is canceled.

(6) When horizontal position d=8 is set, executing a *HT* command moves the next print position to column 9.

(7) Up to 32 horizontal tab positions can be set. If more than 32 horizontal tab positions are set, the data at the excessive tab positions is handled as ordinary data.

(8) The "d" values must be entered in ascending order, and must end with NUL. If the "dN" value is equal to or smaller than the "dN-1 value, processing this *ESC* command is terminated when the dN value is received. The subsequent data is handled as ordinary data.

(9) All horizontal tab positions can be canceled with the *ESC D NUL* command.

(10) When the power to the printer is turned on or the printer is reset, the horizontal tab positions are set for intervals of 8 characters selected in the initial state.

## (19) ESC J + n

[Name] Forward paper feed

[Function] The ESC J + n command feeds paper in the forward direction.

[Code] $[1B]_{16}$ $[4A]_{16}$ [n]
$[27]_{10}$ $[74]_{10}$ [n]

[Explanation]

(1) The *ESC J + n* command feeds paper in the forward direction by "n" dot lines.

(2) Condition $0 \leqq n \leqq 255$ must be satisfied.

(3) When there is data in the print buffer, the data in the print buffer is printed after which paper is fed in the forward direction.

(4) When parameter n specifies 0, the data contained in the buffer is printed but paper is not fed.

## (20) ESC K + n

[Name] Backward paper feed

[Function] The ESC K + n command feeds paper in the backward direction.

[Code] $[1B]_{16}$ $[4B]_{16}$ [n]
$[27]_{10}$ $[75]_{10}$ [n]

[Explanation]

(1) The *ESC K + n* command feeds paper in the backward direction by "n" dot lines. Condition $0 \leqq n \leqq 255$ must be satisfied.

(2) When there is data in the print buffer, the data in the print buffer is printed after which paper is fed in the backward direction.

(3) When parameter n specifies 0, the data contained in the buffer is printed but paper is not fed.

(4) If paper back-feed is executed, paper jam may be occurred. If use this command, it is necessary to confirm application with printer.

(5) If paper back-feed executed, the upper part of character is smashed by gear's back-rush. When the print is execute after back-feeding, feed the paper forward with amount more than back-rush, prevent smash of character.

(6) When this command is executed, the paper must not come off from the rubber roller.

## (21) ESC R + n

[Name] International character specification

[Function] The *ESC R + n* command specifies printing using a specified set of international characters.

[Code] $[1B]_{16}$ $[52]_{16}$ [n]
$[27]_{10}$ $[82]_{10}$ [n]

[Explanation]

(1) The *ESC R + n* command enables a set of international characters (specified with parameter n) to be printed.

(2) The relationship between international characters and parameter n is as shown below.

(3) In the initial state, the domestic character set and character set "Japan" are set.

(4) If the value of parameter n is invalid, this *ESC* command is invalidated. The previous setting is validated.

| n | Code / Country | 23 | 24 | 40 | 5B | 5C | 5D | 5E | 60 | 7B | 7C | 7D | 7E |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 0 | USA | # | $ | @ | [ | ¥ | ] | ^ | ` | { | ¦ | } | ~ |
| 1 | FRENCH | # | $ | à | ° | Ç | § | ^ | ` | é | ù | è | ¨ |
| 2 | GERMAN | # | $ | § | Ä | Ö | Ü | ^ | ` | ä | ö | ü | ß |
| 3 | UK | £ | $ | @ | [ | ¥ | ] | ^ | ` | { | ¦ | } | ~ |
| 4 | DENMARK | # | $ | @ | Æ | Ø | Å | ^ | ` | æ | ø | å | ~ |
| 5 | SWEDEN | # | ¤ | É | Ä | Ö | Å | Ü | é | ä | ö | å | ü |
| 6 | ITALY | # | $ | @ | ° | ¥ | é | ^ | ù | à | ò | è | ì |
| 7 | SPAIN | Pt | $ | @ | ¡ | Ñ | ¿ | ^ | ` | ¨ | ñ | } | ~ |
| 8 | JAPAN | # | $ | @ | [ | ¥ | ] | ^ | ` | { | \| | } | ¯ |
| 9 | NORWAY | # | ¤ | É | Æ | Ø | Å | Ü | é | æ | ø | å | ü |
| 10 | DENMARK2 | # | $ | É | Æ | Ø | Å | Ü | é | æ | ø | å | ü |
| 11 | SPAIN2 | # | $ | á | ¡ | ñ | ¿ | é | ` | í | ñ | ó | ú |
| 12 | RATIN AMERICA | # | $ | á | ¡ | ñ | ¿ | é | Ü | í | ñ | ó | ú |
| 13 | JAPAN2 | # | $ | @ | [ | ¥ | ] | ^ | ` | { | ¦ | } | ~ |

(Each code value is represented in hexadecimal notation.)

n = $[41]_{16}$ Domestic character set ANK
n = $[42]_{16}$ Foreign character set ANK

## (22) ESC V + n

[Name] Right rotation 90°

[Function] The character is rotated right by 90°.

[Code] $[1B]_{16}$ $[56]_{16}$ [n]
$[27]_{10}$ $[86]_{10}$ [n]

[Explanation]

(1) 90° rotation is specified by n and release is set.

| N | Set content |
|---|---|
| 0 | Rotation release of 90° |
| 1 | Rotation specification of 90° |

(2) It is effective to all character kind.

(3) It is invalid concerning the barcode, the image, and the registration image.

(4) A standard print and the rotation print of 90° can exist together in the same line because an automatic changing is not done by this command.

(5) Character font becomes equal to 270° rotation (90° in left rotation) when 90° rotation is specified at upside-down printing.

(6) The direction of the expansion must not rotate with the character when you rotate the length double size and the double width character right by 90°.

## (23) ESC X + n + m

[Name] Setting of time to turn off motor

[Function] The turning off time of the motor excitation current is set.

[Code] $[1B]_{16}$ $[58]_{16}$ [n] [m]
$[27]_{10}$ $[88]_{10}$ [n] [m]

[Explanation]

(1) This command sets the time of the motor until the down of power and power off are done.

(2) Parameter n sets time from the motor stop to the down of power in 0.5 seconds.

(3) Parameter m sets time from the down of power to power off in 0.5 seconds.

(4) An effective range of setting is as follows.
$0 \leqq m \leqq n \leqq 255$ $0 \leqq m \leqq 20$

(5) An initial value is m=2, and n=1.

(6) One aspect of the motor in the current slightly in the time between n and m has been excited.

(7) When the parameter is set in n=255, the printer does neither the down of power nor the power off of the motor.

## (24) ESC Y+1+xa+0+n

(effect only when Flash memory mounted)

[Name] Kanji DATA check

[Function] Sum-check for Kanji DATA is executed.

[Code] $[1B]_{16}$ $[59]_{16}$ $[01]_{16}$ $[78]_{16}$ $[61]_{16}$ $[00]_{16}$ [n]
$[27]_{10}$ $[89]_{10}$ $[1]_{10}$ $[120]_{10}$ $[97]_{10}$ $[0]_{10}$ [n]

[Explanation]

(1) Sum-check for the Flash ROM mounted a circuit board is executed by this command.

(1) The parameter n is sum-check data.
{ Chinese Character Type is Minchou: $n = [E0]_{16}$ MaruGothic:$n=[AD]_{16}$}

(3) If a sum-kanji data of the Flash ROM calculated in printer and the value of the parameter n are different, it is Flash ROM abnormality. And the printer becomes hardware error. (If auto status transmittance is effective, a status of hardware error is transmitted)

(4) A process time of this command is about 2 seconds.

## (25) ESC c + 1 + n

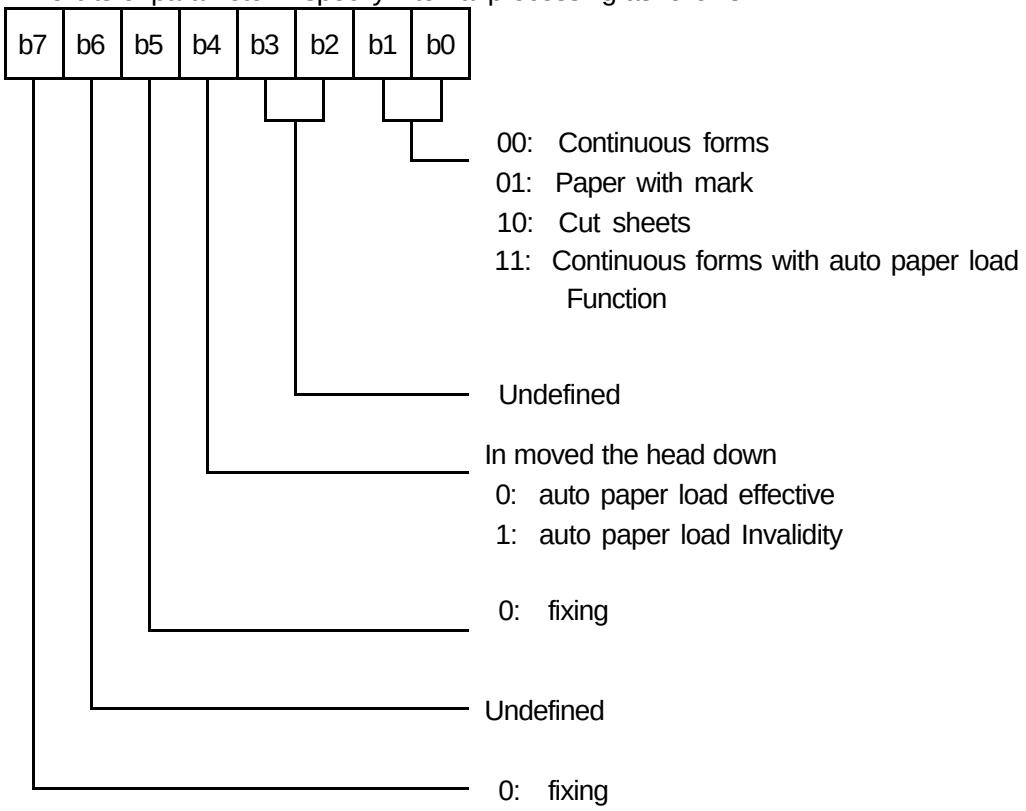
[Name] Internal processing setting

[Function] The ESC c + 1 + n command sets internal processing.

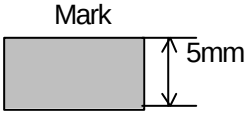
[Code] $[1B]_{16}$ $[63]_{16}$ $[31]_{16}$ [n]
$[27]_{10}$ $[99]_{10}$ $[49]_{10}$ [n]

[Explanation]

(1) The bits of parameter n specify internal processing as follows:



(2) A mark is a black bar with a height of 5 mm.



(3) When the printer is initialized, parameter n is cleared to 0.

(4) If this *ESC* command is issued when there is data in the print buffer, the data in the buffer is printed after which the internal processing is set.

DOCUMENT CONTROL SECTION

SHEET 69

(5) When the specified paper type is a paper with mark, marks are automatically detected when forms are inserted. When the specified paper type is cut sheets, cut sheets are automatically fed when they are set.

(6) If the paper type is changed from "cut sheets" to "other than cut sheets," the existing forms are automatically ejected.

(7) When the specified paper type is continuous form with auto paper load, continuous forms with auto paper load are automatically fed when they are set.

## (26) ESC d + n

[Name] n-line feed

[Function] The ESC d + n command prints the data and feeds a line, then feeds the paper by "n" lines.

[Code] $[1B]_{16}$ $[64]_{16}$ [n]
$[27]_{10}$ $[100]_{10}$ [n]

[Explanation]

(1) The *ESC d + n* command feeds paper by a line count specified with parameter n.

(2) Condition $0 \leqq n \leqq 255$ must be satisfied.

(3) After "n" lines are fed, the data receive position is set at the left edge on the line.

(4) When there is data in the print buffer, the data contained in the buffer is printed after which paper is fed by "n" lines.

## (27) ESC e + n

[Name] Backward n-line feed

[Function] The ESC e + n command prints the data and feeds a line, then feeds the paper in the backward direction by "n" lines.

[Code] $[1B]_{16}$ $[65]_{16}$ [n]
$[27]_{10}$ $[101]_{10}$ [n]

[Explanation]

(1) The *ESC e + n* command feeds paper in the backward direction by the line count specified with parameter n.

(2) Condition $0 \leqq n \leqq 255$ must be satisfied.

(3) After "n" lines are fed, the data receive position is set at the left edge on the line.

(4) When the value of parameter n is 0, the data contained in the buffer is printed but the paper is not fed.

(5) If paper back-feed is executed, paper jam may be occurred. If use this command, it is necessary to confirm application with printer.

(6) If paper back-feed executed, the upper part of character is smashed by gear's back-rush. When the print is execute after back-feeding, feed the paper forward with amount more than back-rush, prevent smash of character.

(7) When this command is executed, the paper must not come off from the rubber roller.

## (28) ESC s + n

[Name] Printing speed setting

[Function] The ESC s + n command sets printing speed.

[Code] $[1B]_{16}$ $[73]_{16}$ [n]
$[27]_{10}$ $[115]_{10}$ [n]

[Explanation]

(1) The *ESC s + n* command sets printing speed.

(2) When there is data in the print buffer, the data contained in the print buffer is printed after which the printing speed is set.

(3) When the same printing speed as the current printing speed is specified with this *ESC* command, no change occurs.

(4) The relationship between parameter n and the specified printing speed is as follows:

| n | Function mode |
|---|---|
| $[60]_{16}$ | High-speed printing mode |
| $[61]_{16}$ | Medium-speed printing mode |
| $[62]_{16}$ | Medium-speed printing mode |
| $[63]_{16}$ | Low-speed printing mode |
| $[64]_{16}$ | Fixed 6 division printing mode (FTP-628MCL series)<br>Fixed 9 division printing mode (FTP-638MCL series) |

(5) If a parameter value not listed in the above table is set, the newly set printing speed is invalidated. The previous printing speed is validated.

(6) An initial value is n=$[60]_{16}$

## (29) ESC t + n

[Name] Character code table selection

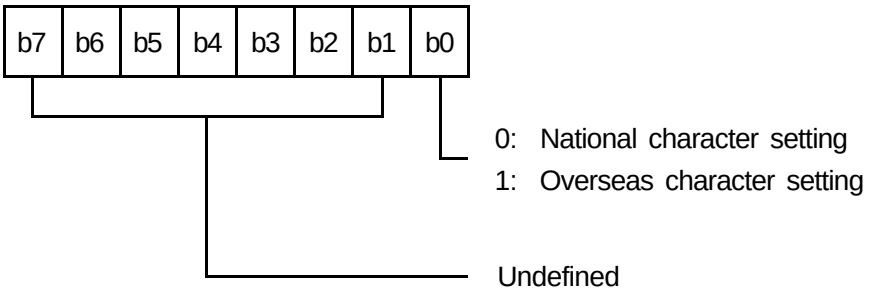
[Function] The ESC t + n command selects page n from the character code table.

[Code] $[1B]_{16}$ $[74]_{16}$ [n]
$[27]_{10}$ $[116]_{10}$ [n]

[Explanation]

(1) The *ESC t + n* command selects page n from the character code table.

(2) The bits of parameter n specify the following information:



(3) The *ESC t + n* command has the same effect as that acquired by specifying $[41]_{16}$ or $[42]_{16}$ in the parameter of the *ESC R* command. Therefore, when both the *ESC t + n* command and the *ESC R* command are specified, the last of these *ESC* commands specified is validated.

(4) The initial value of parameter n is 0.

(5) See Section H, "List of Character Codes."

## (30) ESC { + n

[Name] Upside-down printing setting/cancellation

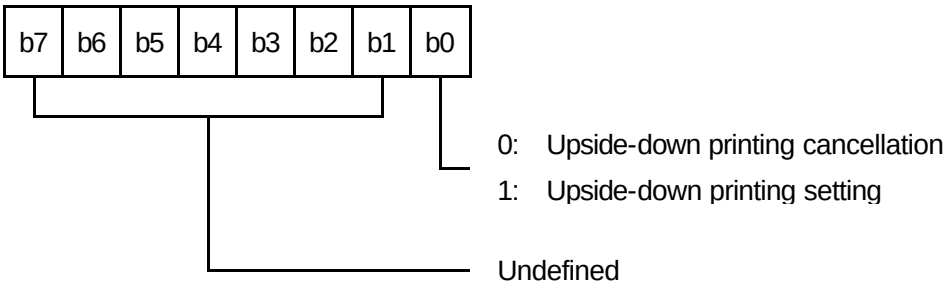
[Function] The ESC { + n command sets or cancels upside-down printing.

[Code] $[1B]_{16}$ $[7B]_{16}$ [n]
$[27]_{10}$ $[123]_{10}$ [n]

[Explanation]

(1) Parameter n sets or cancels upside-down printing.

(2) The bits of parameter n specify the following information:



(3) The *ESC { + n* command can be used in all character modes.

(4) The *ESC { +n* command can also be used in bit image printing.

(5) The character base line is at the bottom of the character typeface. Print character typefaces are arranged so that their bottom ends are aligned at the same level.

SHEET 75

## (31) FS ! + n

(effect only when Flash Memory mounted)

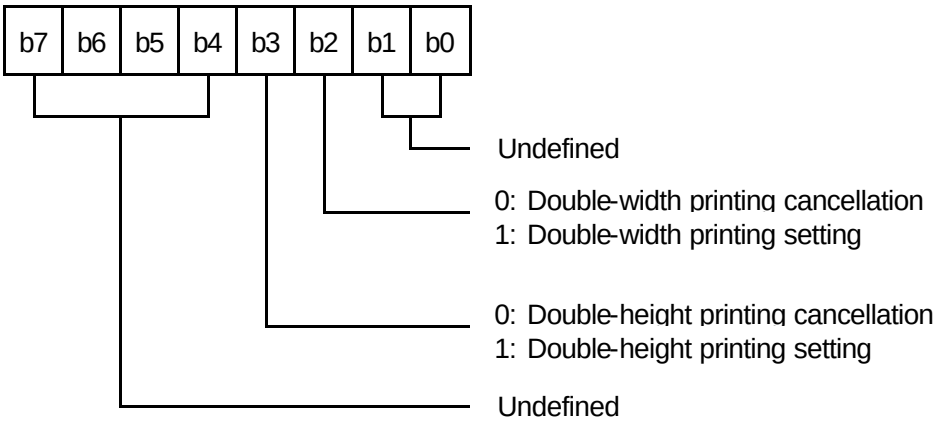
[Name] Kanji printing mode collective specification

[Function] The FS ! + n command specifies kanji printing modes collectively.

[Code] $[1C]_{16}$ $[21]_{16}$ [n]
$[28]_{10}$ $[33]_{10}$ [n]

[Explanation]

(1) The bits of parameter n specify the following information:



(2) When both the double-width printing and double-height printing are specified, double height and width printing is executed.

(3) When one line contains character typefaces with different heights, the character typefaces are arranged so that their base line or bottom ends are aligned at the same level.

(4) When a character typeface is to be extended horizontally, the left edge of the character typeface is fixed and the right edge is extended to the right.

(5) When printing mode is specified with this command and other commands, only the command processed last is validated. For example, the printing mode set with the *FS W* command is invalidated by the *FS ! + n* command.

(6) This command is valid when the Flash ROM is mounted.

## (32) FS &

(effect only when Flash Memory mounted)

[Name] Kanji printing mode specification

[Function] The FS & command specifies kanji printing mode.

[Code] $[1C]_{16}$ $[26]_{16}$
$[28]_{10}$ $[38]_{10}$

[Explanation]

(1) The *FS &* command specifies kanji printing mode.

(2) A kanji character must be represented with a 2-byte code conforming to JIS C6226-$_{1983}$. The first byte then the second byte must be sent.

(3) The size of each kanji typeface must be 16x16 dots or 24x24 dots.

(4) As for the size on the kanji typeface, the font size specified by the ESC ! command is applied. When 8x16 dots is set the size of kanji typeface is 16x16 dots, when 12x24 dots is set, the size of kanji typeface is 24x24 dots.

(5) The size of a character typeface must be selected with a printing mode setting command (*FS !* and *ESC !*). (For details, see "Printing Mode Setting Commands.")

(6) Even if an undefined character code is specified for printing, a character may be printed.

(7) This command is valid when Flash Memory is mounted.

## (33) FS * + m + $n_1$ + $n_2$ + $d_1$ to $d_N$

(effect only when SRAM mounted)

[Name] Bit image printing

[Function] This command specifies the high-speed collective image printing.

[Code] $[1C]_{16}$ $[2A]_{16}$ [m] $[n_1]$ $[n_2]$ $[d_1]$ to $[d_N]$
$[28]_{10}$ $[42]_{10}$ [m] $[n_1]$ $[n_2]$ $[d_1]$ to $[d_N]$

[Explanation]

(1) m specifies the operation mode.

| m | Operation | Caption |
|---|---|---|
| 97 | Print | The image data of SRAM is printed in the n1 + n2 * 256 dot-line. |
| 98 | Download | The image data of the n1 + n2 * 256 dot-line is registered to SRAM. |
| 99 | Print/download | The image data of the n1 + n2 * 256 dot-line is registered to and is printed. |

(2) The number of print lines is specified with n1+n2x256.

(3) The number of maximum lines is as follows for SRAM (64KB) equipped with this board.

| Printer | Print width | Number of maximum lines |
|---|---|---|
| FTP-628MCL | 48 byte | 2643 line |
| FTP-638MCL | 72 byte | 1761 line |

(4) The quantity of image data is (n1+n2 x256)x print width.

(5) With this command, the character data registered into SRAM is overwritten and breaks.

## (34) FS .

(effect only when Flash Memory mounted)

[Name] Kanji printing mode cancellation

[Function] The FS . command cancels kanji printing mode.

[Code] $[1C]_{16}$ $[2E]_{16}$
$[28]_{10}$ $[46]_{10}$

[Explanation]

(1) The *FS* command cancels kanji printing mode.

(2) This command is valid when Flash Memory is mounted.

## (35) FS 9 + n

[Name] Detection function enable/disable setting

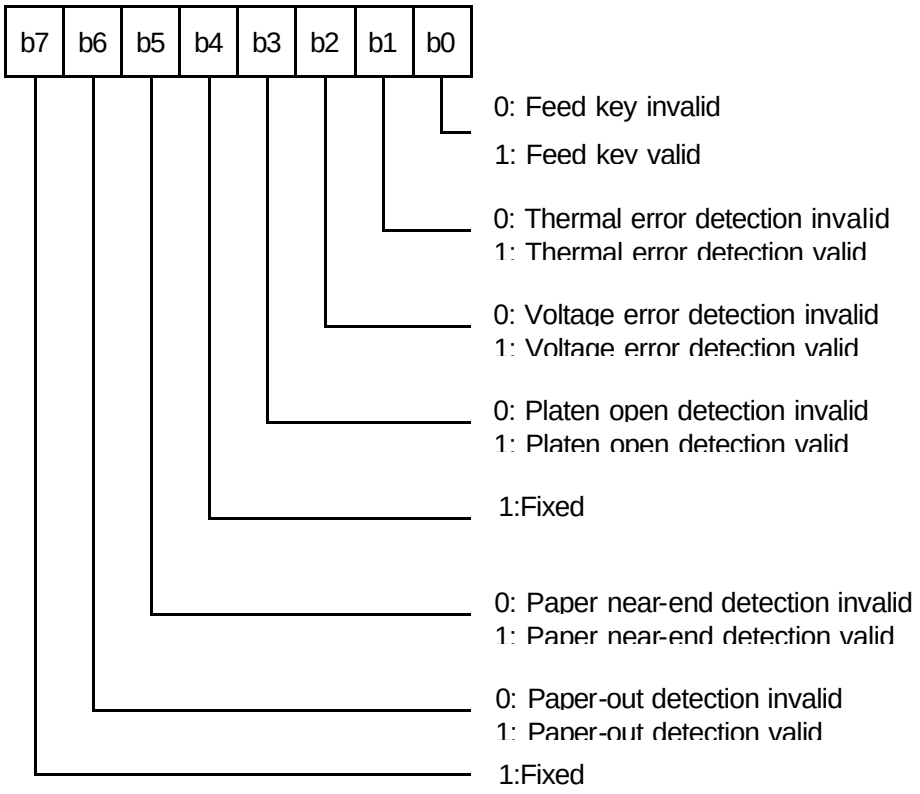
[Function] The FS 9 + n command enables or disables various detection functions.

[Code] $[1C]_{16}$ $[39]_{16}$ [n]
$[28]_{10}$ $[57]_{10}$ [n]

[Explanation]

(1) Condition $0 \leqq n \leqq 255$ must be satisfied.

(2) The bits of parameter n specify the following information:



(3) In the initial state, all of the detection functions other than the paper near-end detection function are valid.

## (36) FS C + n

(Effect only when Flash ROM mounted)

[Name] Kanji code system selection

[Function] The FS C + n command selects kanji code system.

[Code] $[1C]_{16}$ $[43]_{16}$ [n]
$[28]_{10}$ $[67]_{10}$ [n]

[Explanation]

(1) Parameter n specifies the kanji code system as follows:

| n | Selected system |
|---|---|
| 0, 48 | JIS code system |
| 1, 49 | Shift JIS code system |

(2) In each kanji code system, the following code values are valid:
- JIS code system
  Byte 1: $[21]_{16}$ to $[7E]_{16}$
  Byte 2: $[21]_{16}$ to $[7E]_{16}$
- Shift JIS code system
  Byte 1: $[81]_{16}$ to $[9F]_{16}$ and $[E0]_{16}$ to $[EF]_{16}$
  Byte 2: $[40]_{16}$ to $[7E]_{16}$ and $[80]_{16}$ to $[FC]_{16}$

(3) The initial value of parameter n is 0.

(4) Even if a code value outside the permitted range is specified, the character of a font may print.

(5) When the code outside the range is specified when the shift JIS code system is specified, ANK character which corresponds to code is printed.

(6) This command is valid when Flash Memory is mounted.

## (37) FS E + n

[Name] Applied energy adjustment

[Function] Impressed energy is corrected

[Code] $[1C]_{16}$ $[45]_{16}$ [n]
$[28]_{10}$ $[69]_{10}$ [n]

[Explanation]

(1) The correction value is set by n. The range of n is shown below.
$0 \leqq n \leqq 255$

(2) Applierd energy grows by the value of n large.

(3) Please note that the life of the head shortens when the applied energy is too large. There is danger to which the head is disconnected for $n \geqq 128$.

(4) An initial value is n = 43.

## (38) FS r + n

(Effect only when serial interface selected)

[Name] Parameter transmission

[Function] A specified parameter replies when the serial communications mode is selected.

[Code] $[1C]_{16}$ $[72]_{16}$ [n]
$[28]_{10}$ $[114]_{10}$ [n]

[Explanation]
(1) This command is effective only serial communications.
(2) The reply parameter is specified by n.
(3) An initial value is n=0.
(4) The range of n is $0 \leqq n \leqq 255$.
(5) The parameter is transmitted when this command is received. The reply data follows the format of the automatic status transmission and replies parameter n as status in the fourth byte.

| The first byte | The second byte | The third byte | The fourth byte |
|---|---|---|---|
| Printer information | Error information | Paper information | Parameter |

(6) When the parameter reply is done by this command, the automatic status transmission always reaches the value of a specified parameter.
(7) It can be confirmed that the ending of print by this command.

## (39) FS W + n

(Effect only when Flash Memory mounted)

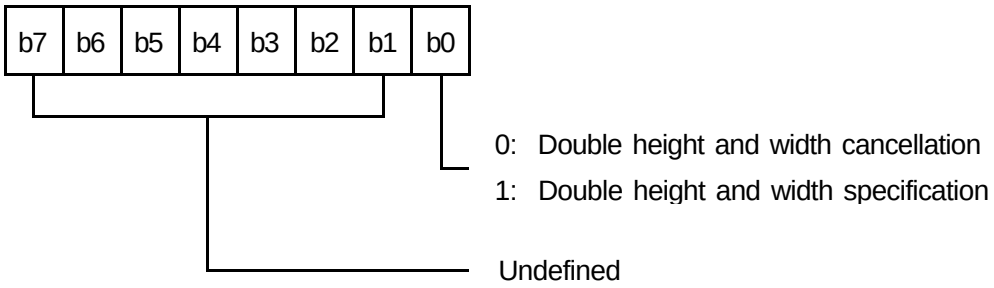
[Name] Kanji double height and width printing specification/cancellation

[Function] The FS W + n command specifies or cancels kanji double height and width printing.

[Code] $[1C]_{16}$ $[57]_{16}$ [n]
$[28]_{10}$ $[87]_{10}$ [n]

[Explanation]

(1) The bits of parameter n specify the following information:



(2) The double height and width size is the same as that acquired when both the double width and double height are specified simultaneously.

(3) When the double height and width mode is canceled with the *FS W + n* command, subsequent characters are printed at ordinary size.

(4) When different-height character typefaces are to be printed on the same line, their base line or bottom ends are aligned at the same level.

(5) When a character typeface is to be extended horizontally, the left edge of the character typeface is fixed and the right edge is extended to the right.

(6) The double height and width mode can also be specified with the *FS !* command by specifying both the double width and double height simultaneously. However, only command executed last is validated. Therefore, when the double height and width mode is specified with an *FS !* command after which the double height and width mode is canceled with an *FS W + n* command, the setting with the *FS !* command is canceled.

(7) This command is valid when Flash Memory is mounted.

## (40) GS & + m + x + $y_1$ + $y_2$ + $d_1$ to $d_N$

(Effect only when Flash Memory mounted)

[Name] Registered bit image definition

[Function] This command defines a registered bit image which has the number of dots specified by x and y.

[Code] $[1D]_{16}$ $[26]_{16}$ [m] [x] [$y_1$] [$y_2$] [$d_1$] to [$d_N$] N=X x ($Y_1$+$Y_2$x256) x 8
$[29]_{10}$ $[42]_{10}$ [m] [x] [$y_1$] [$y_2$] [$d_1$] to [$d_N$]

[Explanation]

(1) Parameter m specifies the identification number of the registered image. An effective range of m is $1 \leqq m \leqq 255$. When two or more images are registered, the image is distinguished with this ID.

(2) X indicates the number of bytes in the horizontal direction, and Y(Y1+Y2x256) indicates the same in the vertical direction.

(3) d indicates the bit image data.

(4) When the number of data is 0, if specified ID has already been registered, that data is deleted. if not, nothing is done.

(5) Header is automatically added to the image data and it is registered. Header is composed of 6 bytes and controls the identification number and the size etc. of the image data.

(6) Registered bit images are not deleted, even if power is shut off.

(7) When the image is registered by GS * command, ID=1 is automatically selected. Therefore, when other data is written in ID=1 by this command, the content registered by GS * command is destroyed.

(8) The capacity of the image data is 128KB. Please note that the data that exceeds this capacity cannot be registered.

FUJITSU COMPONENT LIMITED

SHEET 85/

## (41) GS ‘ + m +n

(Effect only when Flash ROM mounted)

[Name] Registered bit image printing

[Function] This command prints defined registered bit image data in mode m.

[Code] $[1D]_{16}$ $[27]_{16}$ [m] [n]
$[29]_{10}$ $[39]_{10}$ [m] [n]

[Explanation]

(1) n specifies the ID number of the registration image. When the ID number of unregistration is specified, the command is disregarded.

(2) The relationship between the value of m and the content of specification is as follows:

| m | Mode |
|---|---|
| 0, 48 | Normal mode |
| 1, 49 | Double width mode |
| 2, 50 | Double height mode |
| 3, 51 | Double height and width mode |

(3) When registered bit image data is not defined, this command is ignored.

(4) This command is not influenced by other modes (highlighted printing, double printing, underline, character size, etc.) except for upside-down printing mode.

(5) When registered bit image data exceeds printing area, data outside printing area is not printed.

(6) When a registered bit image, character data, bit images, and bar- codes coexist on the same line in page printing mode, the bottom end of a registered bit image is aligned as follows:
- Character data: Bottom ends of characters are aligned.
- Bit image: Bottom ends of bit images are aligned.
- Bar-code: Bottom ends of bar-codes are aligned (HRI characters are not included).

(7) After a registered image is developed, the position of the character development pointer comes to the lower right of the registered image.

## (42) GS <

[Name] Mark detection execution

[Function] The GS < command feeds paper up to the next mark position.

[Code] $[1D]_{16}$ $[3C]_{16}$
$[29]_{10}$ $[60]_{10}$

[Explanation]

(1) The *GS* < command feeds paper up to the next mark position.

(2) After a mark is detected, paper is fed (the head is detected) in accordance with the head detection base; the paper feed then stops.

(3) If no mark is found within the specified page length from the mark-detection-execution starting point, an error is assumed and the page feed stops.

(4) For an explanation of the relationship between mark position and print line position, see the printer mechanism specifications.

## (43) GS A+m+n

[Name] After-mark-detection head distance setting

[Function] The GS A+m+n command sets the head detection distance to be used after mark detection.

[Code] $[1D]_{16}$ $[41]_{16}$ [m] [n]
$[29]_{10}$ $[65]_{10}$ [m] [n]

[Explanation]

(1) The *GS A+m+n* command sets the head detection distance to be used after mark detection.

(2) The value of parameter m is always 0.

(3) Parameter n specifies the head detection distance in dot lines.

(4) Condition $0 \leqq n \leqq 63$ must be satisfied. If an "n" value outside this range is specified, a parameter error occurs. The previous head detection distance is not changed.

(5) When the power is turned on or the printer is reset, parameter m is cleared to 0 and parameter n is set to 16.

## (44) GS E + n

[Name] Print quality setting

[Function] The GS E + n command sets print quality in paper units.

[Code] $[1D]_{16}$ $[45]_{16}$ [n]
$[29]_{10}$ $[69]_{10}$ [n]

[Explanation]

(1) The *GS E + n* command sets print quality for each paper and automatic division print mode is set or canceled.

(2) The five low-order bits of parameter n are used to select paper quality. The three high-order bits of parameter n are disregarded.

(3) The relationship between four low-order bits of parameter n and paper quality is as follows:

| n | Mode | Paper quality | Applicable paper type | Manufacturer |
|---|---|---|---|---|
| 0 | TYPE [1] | | | |
| 1 | TYPE [2] | | | |
| 2 | TYPE [3] | | TF50KS-E4 | Nippon Paper Mfg. Co., Ltd. |
| 3 | TYPE [4] | Standard paper | PD150R, PD170R | Oji Paper Mfg. Co., Ltd. |
| 4 | TYPE [5] | | TP60KJ-R TP60KS-F1 | Nippon Paper Mfg. Co., Ltd. |
| 5 | TYPE [6] | | TF60KS-E P220VBB-1 | Nippon Paper Mfg. Co. Ltd. |
| 6 | TYPE [7] | | HA220AA | Mitsubishi Paper Mills, Ltd. |
| 7 | TYPE [8] | | TL51KS-R2 | Nippon Paper Mfg. Co., Ltd. |
| 8 | TYPE [9] | Long preservation paper | AFP-235 | Mitsubishi Paper Mills, Ltd. |
| 9 | TYPE [10] | | | |
| 10 | TYPE [11] | | | |
| 11 | TYPE [12] | | | |
| 12 | TYPE [13] | Disable to use | | |
| 13 | TYPE [14] | | | |
| 14 | TYPE [15] | | | |
| 15 | TYPE [16] | | | |

(When a paper is chosen . Please evaluate a paper enough for the check of a stickking phenomenon not occurring.)

(4) The initial value of parameter n is 3.

## (45) GS V + n + m

(Effect only a board included a cutter driving circuit)

[Name] Paper cutting

[Function] The paper cut is executed.

[Code] $[1D]_{16}$ $[56]_{16}$ [n] [m]
$[29]_{10}$ $[86]_{10}$ [n] [m]

[Explanation]

(1) The relationship between parameter n and the operation is as follows:

| n | Operation | Note |
|---|---|---|
| 0, 48 | Full cutting | Without m |
| 1,49 | Partial cutting | Without m |
| 65 | Paper feed and full cutting | With m |
| 66 | Paper feed and Partial cutting | With m |

(2) Full cutting completely cut off paper.

(3) Partial cutting leaves part of the paper uncut.

(4) When n is 65 or 66, paper cut is executes after feeding related m. The parameter m indicates the amount of feeding.

(5)The parameter m indicates dot line and can be set range is $0 \leqq m \leqq 255$.

## (46) GS e+n+m

[Name] Bar code width setting

[Function] The GS e+n+m command sets the width of a bar code.

[Code] $[1D]_{16}$ $[65]_{16}$ [n] [m]
$[29]_{10}$ $[101]_{10}$ [n] [m]

[Explanation]

(1) Parameter n specifies the width of a narrow bar in dots.

(2) Parameter m specifies the width of a wide bar in dots.

(3) When the code does not consist of wide bars and/or narrow bars, the value of parameter n is set as the minimum width.

(4) The initial value of parameter n is 2. The initial value of parameter m is 6.

(5) The following conditions must be satisfied:

$1 \leqq n \leqq 255$
$1 \leqq m \leqq 255$

## (48) GS k+m+n+$d_1$ to $d_n$

[Name] Bar code printing

[Function] The GS k+m+n+$d_1$ to $d_n$ command selects a bar code type and prints a bar code.

[Code] $[1D]_{16}$ $[6B]_{16}$ [m] [n] [$d_1$] to [$d_n$]
$[29]_{10}$ $[107]_{10}$ [m] [n] [$d_1$] to [$d_n$]

[Explanation]

(1) Parameter m specifies the type of bar codes to be printed (see the following table):

| m | Type of bar code | Number of records |
|---|---|---|
| 65 | UPC-A | Fixed ($11 \leqq n \leqq 12$) |
| 66 | Undefined | ——— |
| 67 | JAN(EAN)13 | Fixed ($12 \leqq n \leqq 13$) |
| 68 | JAN(EAN)8 | Fixed ($7 \leqq n \leqq 8$) |
| 69 | CODE39 | Variable |
| 70 | ITF | Variable (an even number) |
| 71 | CODABAR | Variable |

(2) The command configuration, code, definition area, and part of the conditions depend on parameter m.

(3) Parameter d specifies the character to be printed. If parameter d specifies a character code that cannot be printed when the data length is fixed, the corresponding bar code is not printed. If parameter d specifies a character code that cannot be printed when the data length is variable, the bar code prior to this command is printed but the subsequent data is handled as ordinary data.

(4) After a bar code is extended, the printing start position is set to the next dot of the bar code end data.

(5) If the print data exceeds the printing area of which width is one line, the overflowing part of the data is ignored.

(6) If the bar code is higher than the line spacing set with the *ESC 2* or *ESC 3* command, paper is fed by the bar code height without regard to the specified line spacing.

(7) When NUL is specified at the check digit position or when an odd number of data records is specified in ITF with m=70, the check digit is calculated automatically. The calculation results are added to the bar code. When data other than NUL is specified at the check digit position, the received data is expanded in the bar code without modifications.

(8) When one line contains both a bar code and characters to be printed, the bottom of these characters and the bottom of the bar code are aligned at the same level.

(9) Two or more bar codes cannot be contained on the same line. If this GS command is received when there is a bar code in the print buffer, the data contained in the print buffer is automatically printed, after which the command is accepted.

(10) A code area which is available to be set by each bar codes is shown as below :

| A kind of bar codes | Code area |
|---|---|
| UPC-A, ITF, EAN-13/8 | '0' ～ '9' |
| CODE 39 | '0' ～ '9', 'A'～ 'Z',' ','$','/','+','%' |
| CODABAR | '0' ～ '9','-','$',':','/','.','+','A'～'D' |

[Name] Bar code width setting

[Function] Bar code width magnification setting

[Code] $[1D]_{16}$ $[77]_{16}$ [n]
$[29]_{10}$ $[119]_{10}$ [n]

[Explanation]

(1) Parameter n specifies the horizontal magnification of a bar code.

(2) Condition $1 \leqq n \leqq 255$ must be satisfied.

(3) The initial value of parameter n is 1.

(4) Both the widths of a narrow bar and a wide bar is multiplied by n times.

## (50) GS a + n

(Effect only when serial interface selected)

[Name] Setting and cancellation of auto status transmission.

[Function] When the serial communications mode is selected, the target status for the automatic status transmission is selected.

[Code] $[1D]_{16}$ $[61]_{16}$ [n]
$[29]_{10}$ $[97]_{10}$ [n]

[Explanation]

(1) The relation of the target status for n and the transmission is as follows.

| Bit | Status | setting |
|---|---|---|
| 0 | Undefined | ———— |
| 1 | State of online/off-line | 0:Invalidity<br>1:Effective |
| 2 | State of error | 0:Invalidity<br>1:Effective |
| 3 | Undefined | ———— |
| 4 | State of automatic paper feed | 0:Invalidity<br>1:Effective |
| 5-7 | Undefined | ———— |

(2) An initial value becomes n=0.

(3) Status is transmitted when this command is received or status is changed. At this time, because each status shows a present state, the status transmission of invalidity is not done.

(4) When all status is invalid, the automatic status transmission is not done.

(5) This command is effective only serial interface board.

(6) There is a possibility to cause the delay between reception of command and sending of status.

(7) The following status in four bytes is transmitted without confirming host's state.

Each code is represented in hexadecimal notation.

**Note 2)**
If an undefined code ($[00]_{16}$ to $[1F]_{16}$) or an undefined ESC, FS, or GS sequence listed in this table is received, an abnormal operation may occur. (However, when image print data, character registration data, or command parameters are received, they are handled as ordinary data.)

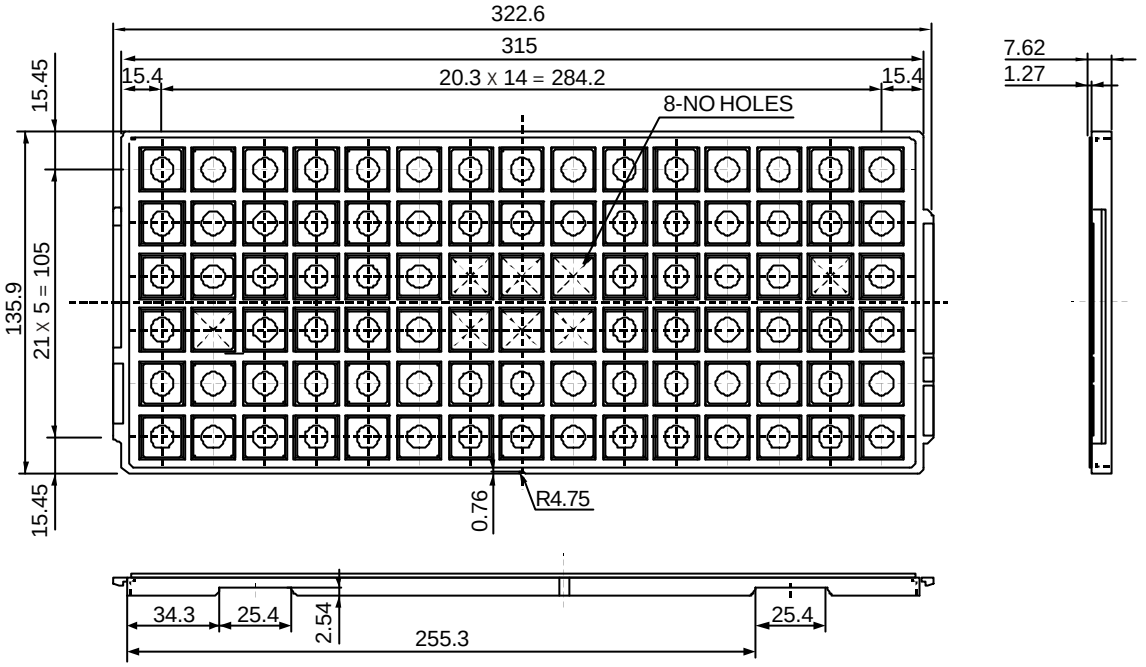
# SECTION J
## Packaging, Stamping and Other Conditions

### 1 Packaging

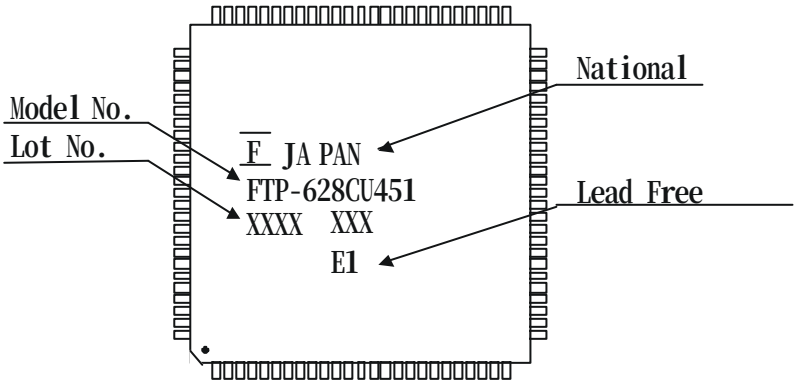
This control board is packed in accordance with Fujitsu component standard packaging specification.



Unit : mm

Material :Conductive polyphenylene ether
The maximum receipt number：90

### 2 Stamping



The type, serial number, and revision information is stamped on the Fujitsu Component standard label affixed to this control board.

## 3 Soldering

(1) It is necessary to solder within 168 hours after packaging was opened.

Storage condition

| | |
|---|---|
| Temperature: | less than 30 degree. |
| Humidity: | 60%Rh |

(2) When over 168 hours, bake with condition below before soldering.

Baking condition

| |
|---|
| 125 ± 10 degree, 16 – 24 Hr |

(3) The recommend temperature profile by re-flow is shown below.

* : No time regulation

## 4 Other condition

(1) Detected errors must be resolved by mutual agreement in accordance with this specification.

(2) To change the contents of this specification, the changes must be reported on and mutually agreed upon in advance.

(3) The model described in this specification is the standard model. Therefore, when functional compatibility is maintained, the items not described in this specification may be changed without prior notice.

(4) If more detailed information is required or ambiguous information is detected, these problems must be resolved by mutual agreement.

# Appendix 1-A
# Setting The Dipswitches

The DIP switches (DSW1) mounted on this board must be set in accordance with the use conditions as explained below.

A-1 DSW1

| Switch No. | Setting Function | Setting | | |
|---|---|---|---|---|
| | | Bit1 | Bit2 | |
| 1,2 | Baud rate | OFF | OFF | 19200BPS |
| | | ON | OFF | 9600BPS |
| | | OFF | ON | 4800BPS |
| | | ON | ON | 2400BPS |

| Switch No. | Setting Function | Setting | |
|---|---|---|---|
| | | ON | OFF |
| 3 | Flow control | XON/XOFF | DTR/DSR |
| 4 | Receiving buffer size | 45 byte | 4k byte |
| 5 | Even/Odd | Even | Odd |
| 6 | Parity | Valid | Invalid |
| 7 | Auto line feed setting | Invalid | Valid |
| 8 | Interface select | RS-232C | Centro |

**Note .**Serial Interface setting:

- Length of stop bit is 1bit fixed.
- Data length setting.is 8bits fixed.
- Only when SRAM mounted,4kbyte of receiving buffer size is able to use.

# Specifications (SW1,2 LED1,2 CN5 )

Signals of SW ,LED and connector No.5 are following.

(Note: Only board of FTP-628/638DSL499)

## B-1 SW1,2 (switch)

| Name | Explanation |
|---|---|
| SW1 | Signal to initialize printer:(/INPRM) |
| SW2 | Paper feed request signal:(/ATF) |

## B-2 LED1,2 (light emitting diode)

| Name | Color | Function |
|---|---|---|
| LED1 | Red | Error detection light<br>(Without mark undetected error) |
| LED2 | Green | 5V Power Supply |

## B-3 CN5 (connector)

(1) Connector Type

B5B-ZR-SM3-TFT made by JST

| No. | Signal Name | Data Direction | Explanation |
|---|---|---|---|
| 1 | GND | --- | Ground of power supply |
| 2 | /INPRM | Input | /INPRM signal |
| 3 | /ATF | Input | /ATF signal |
| 4 | LED1(Red) | Output | Error detection signal<br>(without mark undetected error) |
| 5 | Vcc | Output | 5V Power Supply |

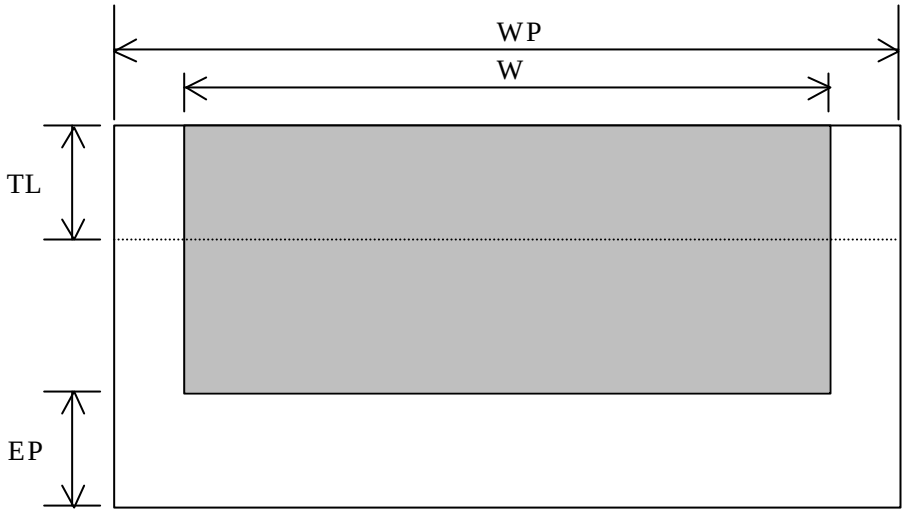
# Appendix 3
# Paper Printing Area and Mark Detection Position

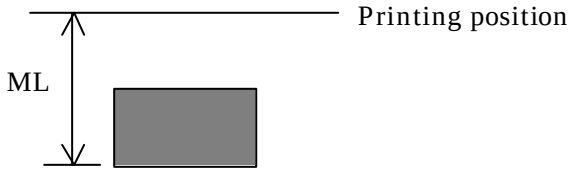
(1) Paper printing area



| Symbol | Explanation | | Length (mm) |
|---|---|---|---|
| WP | Maximum paper width | FTP-628MCLequivalent | About 58 |
| | | FTP-638MCLequivalent | About 80 |
| W | Maximum printable area | FTP-628MCLequivalent | About 48 |
| | | FTP-638MCLequivalent | About 72 |
| EP | Paper out state detection position | FTP-628MCLequivalent | About 9.6 *1 |
| | | FTP-638MCLequivalent | |
| TL | Distance from paper cutting position to print position | | About 7.2 |

**NOTE *1)**
This value varies with the printing mode used.

(2) Mark detection position (when head detection is 2mm)



| Symbol | Explanation | | Length (mm) |
|---|---|---|---|
| ML | Distance from mark position to printing position | FTP-6X8MCL or the equivalent | About 7.6 |

SHEET 120

# Appendix 7
# Conditions for Use

To use the printer with this control board built in, the following conditions must be satisfied.

(1) Power supply

a. The power supply unit that satisfies the specified specification must be used. If power supply unit doses not satisfy the specified specifications are used, normal operation is not assured and errors may occur.

b. When the power is turned on, the MCU must stop until voltage of VH system becomes that 『Depends on cases of that 628/638MCL without cutter：About 3.78V, 628MCL with cutter：About 4.5V, 638MCL with cutter：About 7.2V』 or higher and enters in the state of the standby.

c. The MCU automatically controls the print density in accordance with the detect power voltage. The power voltage is detected every four dot-lines. If the print head power voltage changes during this period, the density cannot be controlled. If the power voltage changes extremely, an overload may apply to the print head. To prevent this, the print head voltage variation must be kept within ±5%.

(2) The printing head heat

a. The print head becomes a high temperature very much along with the print. Please do not touch the print head and the support board directly by the hand.

b. When the print head is pulled down with paper run out state, platen might be transformed by heat.

(3) The motor heat

a. The motor and motor drive element become a high temperature. Please do not touch by the hand.

(4) Cutter

a. Please don't insert fingers or foreign matters to the cutter part. Injuries may be received or troubles may occur.

(5) Paper

a. The recommended paper is wound on a roll. The external side of the rolled paper is the heat-sensitive side. Set the paper so that the heat-sensitive side can touch the print head.

b. If paper is set so that its edge is oblique to the paper guide, a skew feed or jam may occur. Set paper so that its edge is parallel to the paper guide.

c. If the paper that does not satisfy the specified specifications is used, the print quality is not assured and errors may occur.

d. Heat-sensitive paper is liable to deteriorate in a high-temperature, high-humidity environment. Especially when the temperature increases up to 60℃ or higher, coloring may occur. Carefully store heat-sensitive paper.

(6) Paper jam

a. When the paper jam is generated, the power supply of the printer is cut and please raise the head and removes the paper. When working without turning off the power supply of the printer, if the connector comes off, the head is occasionally damaged. Moreover, causes the printer to break down when the printing in the state of the form jam.

(7) Water and foreign matter

a. Adhering liquid such as water or metal chips such as needles and pins to the control board may cause a printer failure.

b. If printing is performed in a condensation state, the print head may be damaged. If condensation is occurred, let the printer dry sufficiently before starting printing.

(8) Impact

a. Because this product is made of precision electronic and mechanical components, do not drop it or hit it with a solid object. Applying the force of an impact to the product may cause errors to occur.

(9) When not using for a long time

a. When the printer is not used for a long time, please put into the state to raise the head. When the head is left lowered, platen might be transformed.

(10) Installation

a. This product must be kept horizontally as much as possible. Use this product in a place free of vibration.

b. Please ground the printer mechanism to FG (frame playground) surely.

c. The printer with this board mounted must not be used in an environment subject to direct sunlight or dust (oil or iron dust).

d. The power supply line must be separated from other devices (e.g., large-sized motors) that cause noise.

e. The printer with this board built in must be installed so that it is positioned as far away as possible from large-noise-emitting devices such as high-voltage devices and large-sized motors.

f. To connect or remove the connector, always turn off the power in advance. If the connector is connected or removed while the power to the printer is on, errors may occur.

g. Please lock surely, and connect the connector of connected each cable correctly. There is no lock mechanism in the connector on the head side and confirm insertion up to the deepest part, please.

h. Impossible power must not join each cable when you mount the printer on the device. Especially, it is necessary to note because the head connection cable influences the pressurizing power of the head. Moreover, please note that causes abnormal heating and the head damage, etc. of the head when the connection of the head connector is imperfect enough about the connector connection.

I. If continuous printing is performed at a high print rate (high print density), the head heat may build up and the head temperature may exceed the maximum usable temperature. In this case, printing may be stopped by the thermal error detection function. Printing resumes automatically after the head cools down to the print enabling temperature.

J. If power is supplied to the print head for a long period of time, the heater may undergo electrolytic corrosion. If the no-printing state continues for a long period of time, turn off the power to the print head and set the printer to the standby state. (See the "*FS 9*" (detection function setting command).)
