

## Quad Supply Voltage Supervisor with Adjustable Delay and Watchdog Timer

Check for Samples: [TPS386000](#), [TPS386040](#)

### FEATURES

- **Four Independent Voltage Supervisors**
- **Channels 1, 2, 3: Adjustable Threshold Down to 0.4V**
- **Channel 4: Adjustable Threshold at Any Positive/Negative Voltage**
- **Adjustable Delay Time: 1.4ms to 10s**
- **Threshold Accuracy: 0.25% typ**
- **Very Low Quiescent Current: 11µA typ**
- **Channel 1: Manual Reset ( $\overline{\text{MR}}$ ) Input**
- **Channel 4: Window Comparator**
- **Watchdog Timer with Dedicated Output**
- **Well-Controlled Output During Power-Up**
- **TPS386000: Open-Drain  $\overline{\text{RESETn}}$  and  $\overline{\text{WDO}}$**
- **TPS386040: Push-Pull  $\overline{\text{RESETn}}$  and  $\overline{\text{WDO}}$**
- **Package: 4mm x 4mm, 20-pin QFN**

### APPLICATIONS

- **All DSP and Microcontroller Applications**
- **All FPGA/ASIC Applications**
- **Telecom/Wireless Infrastructure**
- **Industrial Equipment**
- **Analog Sequencing**

### DESCRIPTION

The TPS3860x0 family of supply voltage supervisors (SVSs) can monitor four power rails that are greater than 0.4V and one power rail less than 0.4V (including negative voltage) with a 0.25% (typical) threshold accuracy. Each of the four supervisory circuits (SVS-n) assert a  $\overline{\text{RESETn}}$  or  $\overline{\text{RESETn}}$  output signal when the SENSEm input voltage drops below the programmed threshold. With external resistors, the threshold of each SVS-n can be programmed (where  $n = 1, 2, 3, 4$  and  $m = 1, 2, 3, 4L, 4H$ ).

Each SVS-n has a programmable delay before releasing  $\overline{\text{RESETn}}$  or  $\overline{\text{RESETn}}$ . The delay time can be set independently for each SVS from 1.4ms to 10s through the CTn pin connection. Only SVS-1 has an active-low manual reset ( $\overline{\text{MR}}$ ) input; a logic-low input to MR asserts  $\overline{\text{RESET1}}$  or  $\overline{\text{RESET1}}$ .

SVS-4 monitors the threshold window using two comparators. The extra comparator can be configured as a fifth SVS to monitor negative voltage with voltage reference output VREF.

The TPS3860x0 has a very low quiescent current of 11µA (typical) and is available in a small, 4mm x 4mm, QFN-20 package.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Over operating junction temperature range, unless otherwise noted.

	TPS3860x0	UNIT
Input voltage range, $V_{VCC}$	–0.3 to 7.0	V
CT pin voltage range, $V_{CT1}$ , $V_{CT2}$ , $V_{CT3}$ , $V_{CT4}$	–0.3 to $V_{VCC} + 0.3$	V
Other voltage ranges: $V_{RESET1}$ , $V_{RESET2}$ , $V_{RESET3}$ , $V_{RESET4}$ , $V_{MR}$ , $V_{SENSE1}$ , $V_{SENSE2}$ , $V_{SENSE3}$ , $V_{SENSE4L}$ , $V_{SENSE4H}$ , $V_{WDI}$ , $V_{WDO}$	–0.3 to 7.0	V
$RESET\bar{n}$ , $RESETn$ , $WDO$ , $WDO$ , $VREF$ pin current	5	mA
Continuous total power dissipation	See <a href="#">Dissipation Ratings Table</a>	
Operating virtual junction temperature range, $T_J$ <sup>(2)</sup>	–40 to +150	°C
Operating ambient temperature range	–40 to +125	°C
Storage temperature range, $T_{STG}$	–65 to +150	°C
ESD rating	Human body model (HBM)	2 kV
	Charged device model (CDM)	500 V

- (1) Stresses beyond those listed under the *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under the recommended operating conditions is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- (2) As a result of the low dissipated power in this device, it is assumed that  $T_J = T_A$ .

### DISSIPATION RATINGS

PACKAGE	$T_A < +25^\circ\text{C}$ POWER RATING	DERATING FACTOR ABOVE $T_A > +25^\circ\text{C}$	$T_A = +70^\circ\text{C}$ POWER RATING	$T_A = +85^\circ\text{C}$ POWER RATING

- (1) Toggling  $\text{WDI}$  for a period less than  $t_{\text{WDT}}$  negatively affects  $I_{\text{VCC}}$ .
- (2) These specifications are beyond the recommended  $V_{\text{VCC}}$  range, and only define  $\overline{\text{RESETn}}$  or  $\text{RESETn}$  output performance during  $V_{\text{CC}}$  ramp up.
- (3) The lowest supply voltage ( $V_{\text{VCC}}$ ) at which  $\overline{\text{RESETn}}$  or  $\text{RESETn}$  becomes active;  $t_{\text{RISE}}(V_{\text{CC}}) \geq 15\mu\text{s/V}$ .
- (4) CTn (where  $n = 1, 2, 3$ , or  $4$ ) are constant current charging sources working from a range of  $0\text{V}$  to  $V_{\text{TH(CTn)}}$ , and the device is tested at  $V_{\text{CTn}} = 0.5\text{V}$ . For  $I_{\text{CT}}$  performance between  $0\text{V}$  and  $V_{\text{TH(CTn)}}$ , see [Figure 23](#).

## PIN CONFIGURATIONS

## PIN ASSIGNMENTS

PIN		DESCRIPTION	
NAME	NO.		
VCC	14	Supply voltage. Connecting a 0.1μF ceramic capacitor close to this pin is recommended.	
GND	12	Ground	
SENSE1	10	Monitor voltage input to SVS-1	When the voltage at this terminal drops below the threshold voltage ( $V_{ITN}$ ), <u>RESET1</u> is asserted.
SENSE2	9	Monitor voltage input to SVS-2	When the voltage at this terminal drops below the threshold voltage ( $V_{ITN}$ ), <u>RESET2</u> is asserted.
SENSE3	8	Monitor voltage input to SVS-3	When the voltage at this terminal drops below the threshold voltage ( $V_{ITN}$ ), <u>RESET3</u> is asserted.
SENSE4L	7	Falling monitor voltage input to SVS-4. When the voltage at this terminal drops below the threshold voltage ( $V_{ITN}$ ), <u>RESET4</u> or <u>RESET4</u> is asserted.	
SENSE4H	6	Rising monitor voltage input to SVS-4. When the voltage at this terminal exceeds the threshold voltage ( $V_{ITP}$ ), <u>RESET4</u> or <u>RESET4</u> is asserted. This pin can also be used to monitor the negative voltage rail in combination with VREF pin. Connect to GND if not being used.	
CT1	5	Reset delay programming pin for SVS-1	Connecting this pin to VCC through a 40kΩ to 200kΩ resistor, or leaving it open, selects a fixed delay time (see the <a href="#">Electrical Characteristics</a> ). Connecting a capacitor > 220pF between this pin and GND selects the programmable delay time (see the <a href="#">Reset Delay Time</a> section).
CT2	4	Reset delay programming pin for SVS-2	
CT3	3	Reset delay programming pin for SVS-3	
CT4	2	Reset delay programming pin for SVS-4	
VREF	13	Reference voltage output. By connecting a resistor network between this pin and the negative power rail, SENSE4H can monitor the negative power rail. This pin is intended to only source current into resistor(s). Do not connect resistor(s) to a voltage higher than 1.2V. Do not connect only a capacitor.	
<u>MR</u>	1	<u>Manual reset input for SVS-1. Logic low level of this pin asserts <u>RESET1</u> or <u>RESET1</u>.</u>	
WDI	20	Watchdog timer (WDT) trigger input. Inputting either a positive or negative logic edge every 610ms (typ) prevents WDT time out at the <u>WDO</u> or <u>WDO</u> pin. Timer starts from releasing event of <u>RESET1</u> or <u>RESET1</u> .	
NC	11	Not connected. It is recommended to connect this pin to the GND pin (pin 12), which is next to this pin.	
(Thermal Pad)	(PAD)	This is the IC substrate. This pad must be connected only to GND or to the floating thermal pattern on the printed circuit board (PCB).	

### PIN ASSIGNMENTS (continued)

PIN		DESCRIPTION	
NAME	NO.		
TPS386000			
$\overline{\text{RESET1}}$	15	Active low reset output of SVS-1	$\overline{\text{RESETn}}$ is an open-drain output pin. When $\overline{\text{RESETn}}$ is asserted, this pin remains in a low-impedance state. When $\overline{\text{RESETn}}$ is released, this pin goes to a high-impedance state after the delay time programmed by CTn.
$\overline{\text{RESET2}}$	16	Active low reset output of SVS-2	
$\overline{\text{RESET3}}$	17	Active low reset output of SVS-3	
$\overline{\text{RESET4}}$	18	Active low reset output of SVS-4	
$\overline{\text{WDO}}$	19	Watchdog timer output. This is an open-drain output pin. When WDT times out, this pin goes to a low-impedance state to GND. If there is no WDT timeout, this pin stays in a high-impedance state.	
TPS386040			
$\overline{\text{RESET1}}$	15	Active low reset output of SVS-1	$\overline{\text{RESETn}}$ is a push-pull logic buffer output pin. When $\overline{\text{RESETn}}$ is asserted, this pin remains logic low. When $\overline{\text{RESETn}}$ is released, this pin goes to logic high after the delay time programmed by CTn.
$\overline{\text{RESET2}}$	16	Active low reset output of SVS-2	
$\overline{\text{RESET3}}$	17	Active low reset output of SVS-3	
$\overline{\text{RESET4}}$	18	Active low reset output of SVS-4	
$\overline{\text{WDO}}$	19	Watchdog timer output. This is a push-pull output pin. When WDT times out, this pin goes to logic low. If there is no WDT timeout, this pin stays in logic high.

## PARAMETRIC MEASUREMENT INFORMATION

### TEST CIRCUIT

## GENERAL DESCRIPTION

The TPS3860x0 multi-channel supervisory device family combines four complete SVS function sets into one IC, along with a watchdog timer, a window comparator, and negative voltage sensing. The design of each SVS channel is based on the single-channel supervisory device series, [TPS3808](#). The TPS3860x0 is designed to assert  $\overline{\text{RESET}}_n$  or  $\text{RESET}_n$  signals, as shown in [Table 1](#), [Table 2](#), [Table 3](#), and [Table 4](#). The  $\overline{\text{RESET}}_n$  or  $\text{RESET}_n$  outputs remain asserted during a

user-configurable delay time after the event of reset release (see the [Reset Delay Time](#) section). Each  $\text{SENSE}_m$  ( $m = 1, 2, 3, 4L$ ) pin can be set to any voltage threshold above 0.4V using an external resistor divider. The  $\text{SENSE4H}$  pin can be used for any overvoltage detection greater than 0.4V, or for negative voltage detection using an external resistor divider (see the [Sensing Voltage Less Than 0.4V](#) section). A broad range of voltage threshold and reset delay time adjustments can be supported, allowing these devices to be used in a wide array of applications.

**Table 1. SVS-1 Truth Table**

CONDITION		OUTPUT	STATUS
$\overline{\text{MR}} = \text{Low}$	$\text{SENSE1} < V_{\text{ITN}}$	$\overline{\text{RESET}}_1 = \text{Low}$	Reset asserted

High	Low	Released	610ms after last $\text{WDI}\uparrow$ or $\text{WDI}\downarrow$	$\overline{\text{WDO}} = \text{low}$	Enters WDT timeout

## RESET OUTPUT

In a typical TPS3860x0 application,  $\overline{\text{RESETn}}$  or RESETn outputs are connected to the reset input of a processor (DSP, CPU, FPGA, ASIC, etc.), or connected to the enable input of a voltage regulator (DC-DC, LDO, etc.)

The TPS386000 provides open-drain reset outputs. Pull-up resistors must be used to hold these lines high when RESETn is not asserted, or when RESETn is asserted. By connecting pull-up resistors to the proper voltage rails (up to 6.5V), RESETn or RESETn output nodes can be connected to the other devices at the correct interface voltage levels. The pull-up resistor should be no smaller than 10k $\Omega$  because of the safe operation of the output transistors. By using wired-OR logic, any combination of RESETn can be merged into one logic signal.

The TPS386040 provides push-pull reset outputs. The logic high level of the outputs is determined by the VCC voltage. With this configuration, pull-up resistors are not required and some board area can be saved. However, all the interface logic levels should be examined. All  $\overline{\text{RESETn}}$  or RESETn connections must be compatible with the VCC logic level.

The  $\overline{\text{RESETn}}$  or RESETn outputs are defined for VCC voltage higher than 0.9V. To ensure that the target processor(s) are properly reset, the VCC supply input should be fed by the available power rail as early as possible in application circuits. Table 1, Table 2, Table 3, and Table 4 are truth tables that describe how the outputs are asserted or released. Figure 24, Figure 25, Figure 26, and Figure 27 show the SVS-n timing diagrams. When the condition(s) are met, the device changes the state of SVS-n from asserted to released after a user-configurable delay time. However, the transitions from released-state to asserted-state are performed almost immediately with

minimal propagation delay. Figure 26 describes relationship between threshold voltages ( $V_{\text{ITN}}$  and  $V_{\text{HYSN}}$ ) and SENSEm voltage; and all SVS-1, SVS-2, SVS-3, and SVS-4 have the same behavior of Figure 26.

Figure 24. SVS-1 Timing Diagram

Figure 25. SVS-2 Timing Diagram

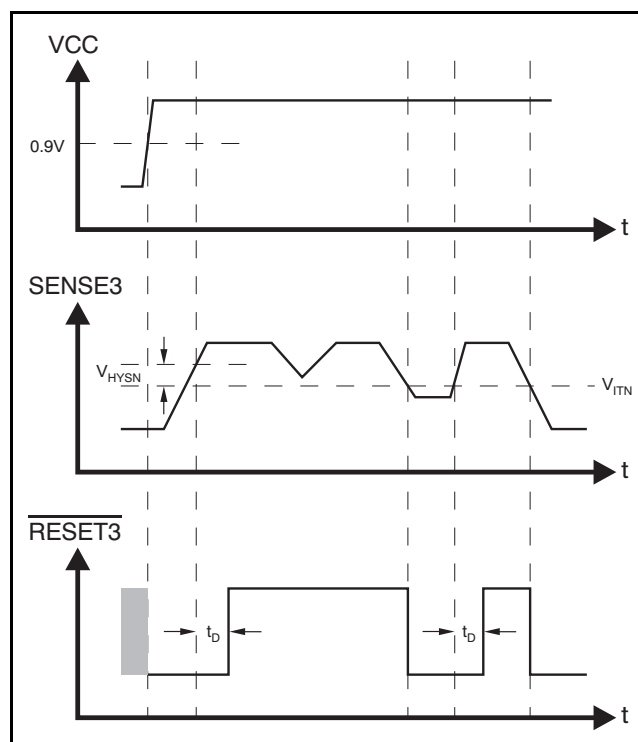

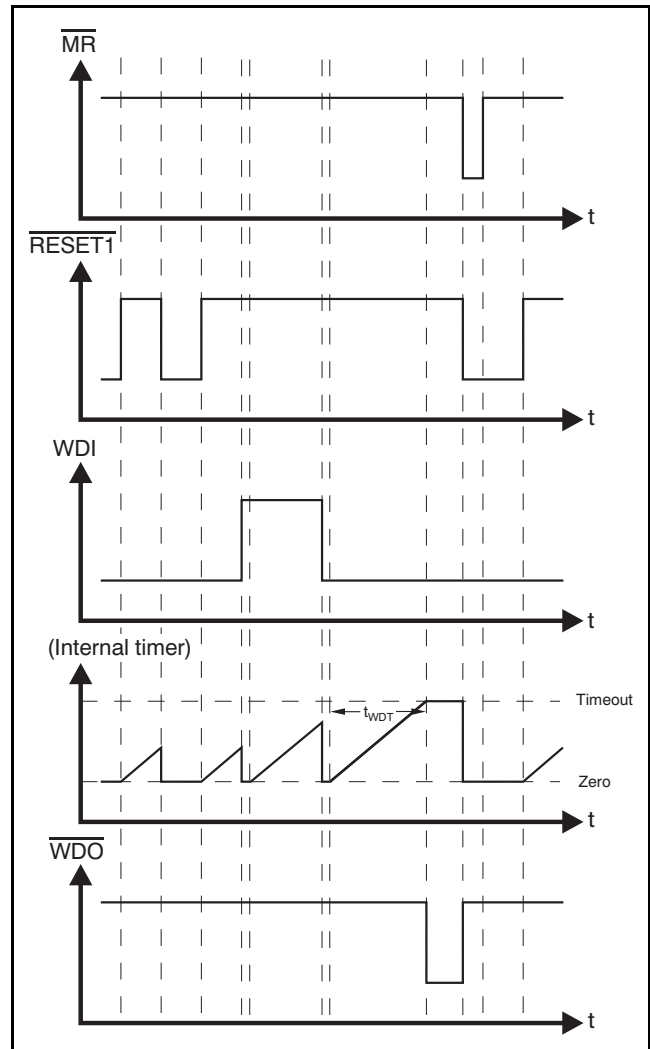

Figure 26. SVS-3 Timing Diagram

**Figure 27. SVS-4 Timing Diagram**

**Figure 28. WDT Timing Diagram**

The SENSEm inputs are pins that allow any system voltages to be monitored. If the voltage at the SENSE1, SENSE2, SENSE3, or SENSE4L pins drops below  $V_{ITN}$ , then the corresponding reset outputs are asserted. If the voltage at the SENSE4H pin exceeds  $V_{ITP}$ , then RESET4 or RESET4 is asserted. The comparators have a built-in hysteresis to ensure smooth reset output assertions and deassertions. Although not required in most cases, for extremely noise applications, it is good analog

$$VCC3\_target = (1 + R_{S3H}/R_{S3L}) \times 0.4 \text{ (V)} \quad (3)$$

## WINDOW COMPARATOR

The comparator at the SENSE4H pin has the opposite comparison polarity to the other SENSEm pins. In the configuration shown in Figure 30, this comparator monitors overvoltage of the VCC4 node; combined with the comparator at SENSE4L, SVS-4 forms a window comparator.

$$VCC4\_target1 = \{1 + R_{S4H}/(R_{S4M} + R_{S4L})\} \times 0.4 \text{ (V)} \quad (4)$$

$$VCC4\_target2 = \{1 + (R_{S4H} + R_{S4M})/R_{S4L}\} \times 0.4 \text{ (V)} \quad (5)$$

Where VCC4\_target1 is the undervoltage threshold, and VCC4\_target2 is the overvoltage threshold.

## SENSING VOLTAGE LESS THAN 0.4V

By using voltage reference output VREF, the SVS-4 comparator can monitor negative voltage or positive

voltage lower than 0.4V. Figure 31 shows this usage in an application circuit. SVS-4 monitors the positive and negative voltage power rail (for example, +15V and –15V supply to an op amp) and the RESET4 or RESET4 output status continues to be as described in Table 4. Note that R<sub>S42H</sub> is located at higher voltage position than R<sub>S42L</sub>. The threshold voltage calculations are shown in the following equations:

$$VCC41\_target = (1 + R_{S41H}/R_{S41L}) \times 0.4 \text{ (V)} \quad (6)$$

$$VCC42\_target = (1 + R_{S42L}/R_{S42H}) \times 0.4 - R_{S42L}/R_{S42H} \times V_{REF} \quad (7)$$

$$= 0.4 - (R_{S42L}/R_{S42H} \times 0.8 \text{ (V)}) \quad (8)$$

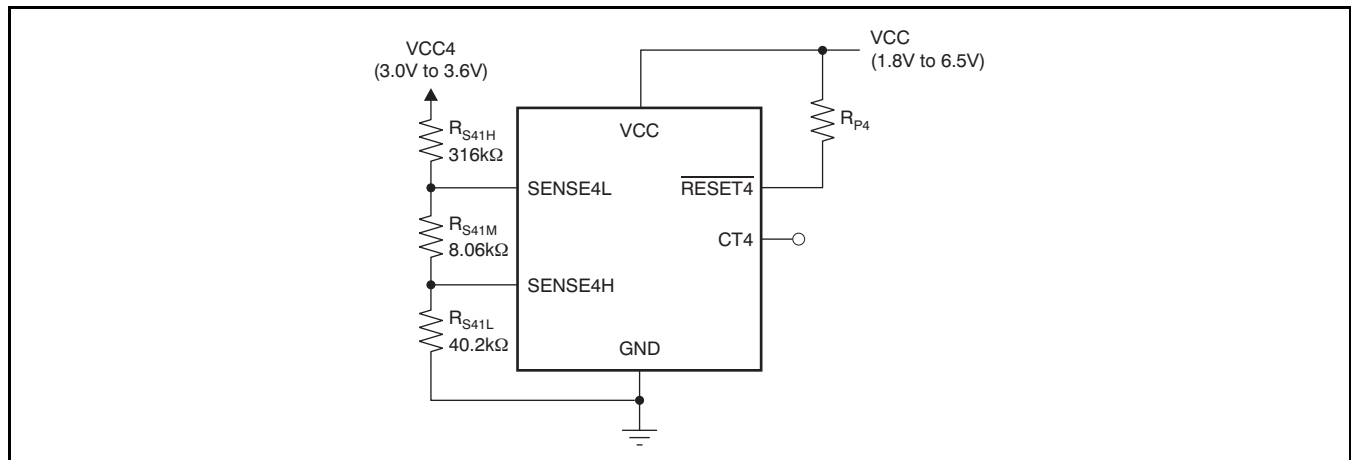

Figure 30. SVS-4: Window Comparator

Figure 31. SVS4: Negative Voltage Sensing

## RESET DELAY TIME

Each of the SVS-n channels can be configured independently in one of three modes. [Table 6](#) describes the delay time settings.

**Table 6. Delay Timing Selection**

CTn CONNECTION	DELAY TIME
Pull-up to VCC	300ms (typ)
Open	20 ms (typ)
Capacitor to GND	Programmable

To select the 300ms fixed delay time, the CTn pin should be pulled up to VCC using a resistor from 40kΩ to 200kΩ. Please note that there is a pulldown transistor from CTn to GND that turns on every time the device powers on to determine and confirm CTn pin status; therefore, a direct connection of CTn to VCC causes a large current flow. To select the 20ms fixed delay time, the CTn pin should be left open. To program a user-defined adjustable delay time, an external capacitor must be connected between CTn and GND. The adjustable delay time can be calculated by the following equation:

$$C_{CT} \text{ (nF)} = [t_{\text{DELAY}} \text{ (ms)} - 0.5 \text{ (ms)}] \times 0.242 \quad (9)$$

Using this equation, a delay time can be set to between 1.4ms to 10s. The external capacitor should be greater than 220pF (nominal) so that the TPS3860x0 can distinguish it from an open CT pin. The reset delay time is determined by the time it takes an on-chip, precision 300nA current source to charge the external capacitor to 1.24V. When the  $\overline{\text{RESETn}}$  or RESETn outputs are asserted, the corresponding capacitors are discharged. When the condition to release  $\overline{\text{RESETn}}$  or RESETn occurs, the internal current sources are enabled and begin to charge the external capacitors. When the CTn voltage on a capacitor reaches 1.24V, the corresponding  $\overline{\text{RESETn}}$  or RESETn pins are released. Note that a low leakage type capacitor (such as ceramic) should be used, and that stray capacitance around this pin may cause errors in the reset delay time.

## MANUAL RESET

The manual reset ( $\overline{\text{MR}}$ ) input allows external logic signal from other processors, logic circuits, and/or discrete sensors to initiate a device reset. Because  $\overline{\text{MR}}$  is connected to SVS-1, the RESET1 or RESET1 pin is intended to be connected to processor(s) as a

primary reset source. A logic low at  $\overline{\text{MR}}$  causes RESET1 or RESET1 to assert. After  $\overline{\text{MR}}$  returns to a logic high and SENSE1 is above its reset threshold, RESET1 or RESET1 is released after the user-configured reset delay time. Note that unlike the [TPS3808](#) series, the TPS3860x0 does not integrate an internal pull-up resistor between  $\overline{\text{MR}}$  and VCC.

To control the  $\overline{\text{MR}}$  function from more than one logic signal, the logic signals can be combined by wired-OR into the  $\overline{\text{MR}}$  pin using multiple NMOS transistors and one pull-up resistor.

## WATCHDOG TIMER

The TPS3860x0 provides a watchdog timer with a dedicated watchdog error output,  $\overline{\text{WDO}}$  or WDO. The  $\overline{\text{WDO}}$  or WDO output enables application board designers to easily detect and resolve the hang-up status of a processor. As with  $\overline{\text{MR}}$ , the watchdog timer function of the device is also tied to SVS-1. [Figure 28](#) shows the timing diagram of the WDT function. Once  $\overline{\text{RESET1}}$  or RESET1 is released, the internal watchdog timer starts its countdown. Inputting a logic level transition at WDI resets the internal timer count and the timer restarts the countdown. If the TPS3860x0 fails to receive any WDI rising or falling edge within the WDT period, the WDT times out and asserts  $\overline{\text{WDO}}$  or WDO. After  $\overline{\text{WDO}}$  or WDO is asserted, the device holds the status with the internal latch circuit. To clear this timeout status, a reset assertion of  $\overline{\text{RESET1}}$  or RESET1 is required. That is, a negative pulse to  $\overline{\text{MR}}$ , a SENSE1 voltage less than  $V_{\text{ITN}}$ , or a VCC power-down is required.

To reset the processor by WDT timeout,  $\overline{\text{WDO}}$  can be combined with  $\overline{\text{RESET1}}$  by using the wired-OR with the TPS386000 option.

For legacy applications where the watchdog timer timeout causes  $\overline{\text{RESET1}}$  to assert, connect  $\overline{\text{WDO}}$  to  $\overline{\text{MR}}$ ; see [Figure 29](#) for the connections and see [Figure 32](#) and [Figure 33](#) for the timing diagram.

## IMMUNITY TO SENSEn VOLTAGE TRANSIENTS

The TPS3860x0 is relatively immune to short negative transients on the SENSEn pin. Sensitivity to transients depends on threshold overdrive, as shown in the typical performance graph *TPS386040 SENSEn Minimum Pulse Width vs SENSEn Threshold Overdrive Voltage* ([Figure 9](#)).

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

### Changes from Revision C (August 2011) to Revision D Page

- Deleted TPS386020 and TPS386060 devices from data sheet ..... 1

### Changes from Revision B (March 2011) to Revision C Page

- Changed [Figure 2](#) ..... 7

### Changes from Revision A (January 2010) to Revision B Page

- Changed data sheet title ..... 1
- Changed Features bullets ..... 1
- Changed Applications bullets ..... 1
- Changed first sentence of second paragraph in Description text ..... 1
- Changed low quiescent current value in last paragraph of Description text from 12 $\mu$ A to 11 $\mu$ A ..... 1
- Changed front-page typical application circuit figure ..... 1
- Added sentence to pin 6 description in Pin Assignments table ..... 4
- Changed last sentence of pin 13 description in Pin Assignments table ..... 4
- Added text to first sentence of first paragraph of *General Description* section. .... 12
- Changed caption for [Figure 29](#) ..... 16
- Changed link in *Window Comparator* section to new [Figure 30](#) ..... 17
- Deleted typo in [Equation 4](#) and moved [Equation 4](#) to *Window Comparator* section ..... 17
- Deleted typo in [Equation 5](#) and moved [Equation 5](#) to *Window Comparator* section ..... 17
- Changed link in *Sensing Voltage Less Than 0.4V* section to new [Figure 31](#) ..... 17
- Added [Figure 30](#) ..... 17
- Added [Figure 31](#) ..... 17

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
TPS386000RGPR	ACTIVE	QFN	RGP	20	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TPS 386000	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

4203555/G 07/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. Check thermal pad mechanical drawing in the product datasheet for nominal lead length dimensions.

RGP (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

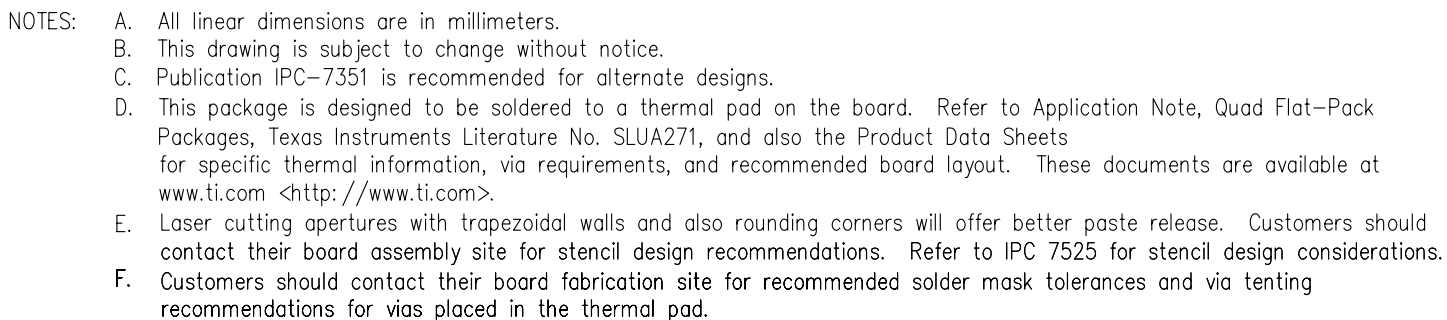

Bottom View

Exposed Thermal Pad Dimensions

4206346-2/AA 11/13

NOTES: A. All linear dimensions are in millimeters

B. The Pin 1 Identification mark is an optional feature that may be present on some devices. In addition, this Pin 1 feature if present is electrically connected to the center thermal pad and therefore should be considered when routing the board layout.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
